1351. DSP-2232/PACSAT Users

Newsgroup: rec.radio.amateur.space
Date: 1994-09-02 14:22:59 UTC
From: marcoh@world.std.com
Message-ID: <CvIAMD.2D9@world.std.com>
Source record: 27055

--

If you have an AEA DSP-2232 and you are active on the PACSATs,
I would like to hear from you!

I've worked terrestrial packet for some time, but I have only recently given working the PACSATs a try (after much trial and error, I recently downloaded a file from AO-16 for the first time). I am looking for insights into optimal use of a 2232 with satellites, especially AEA upgrades, hardware and software mods, and tips and techniques you found particularly useful. Also, if there is a 2232 UG/mailing list/forum, I'd like to know how to join/subscribe.

I seldom get onto UseNet, but if you have the time and inclination for direct email, you can reach me at:

marcoh@world.std.com
n1mae@amsat.org
n1mae@switch.lmnstr.ampr.org

1353. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-09-02 23:06:15 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.778547175@afit.af.mil>
Source record: 27056
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6

1354. Two-Line Orbital Element Sets (TLE461)

Newsgroup: rec.radio.amateur.space
Date: 1994-09-02 23:08:18 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.778547298@afit.af.mil>
Source record: 27057

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1355. WISP

Newsgroup: rec.radio.amateur.space
Date: 1994-09-03 17:48:26 UTC
From: GerryP@Interlink.NET
Message-ID: <GerryP.3.0011CF30@Interlink.NET>
Source record: 27059

I have recently learned that there is a new satellite tracking or telemetry decoding software called WISP. Could anyone tell me where I can find this software and what is it used for ? 73 de Gerry, VE2AW

1356. WWW Site?

Newsgroup: rec.radio.amateur.space
Date: 1994-09-04 05:49:10 UTC
From: phulse@netcom.com
Message-ID: <phulseCvLC5z.17K@netcom.com>
Source record: 27060

I heard that AMSAT has a WWW site. Does anyone have the address of it?

Thanks.

1357. Sept VHF QSO Party 9/10 - 9/12 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-09-04 18:57:00 UTC
From: tim.marek@megasystem.com
Message-ID: <215.367.1443.0NA708BB@megasystem.com>
Source record: 26961

Fellow VHF Contesters...
NC7K - Tim
Will be QRV once again from 8100 FT. Pond Peak here in DM09 (Near Reno).
With access to 110V AC power I'm bringing the 4CX250B amp for 144 Mhz.
Stations will be as follows....
50 Mhz - FT-620B driving N4LTA 100W brick into 4 ele Homebrew K6STI
144 Mhz - TS770 Driving single 4CX250B to 350W into 12 ele NBS Yagi
432 Mhz - TS770 driving RFC 110W brick into 16 ele NBS yagi
3.818 Mhz HF for Liason. SKEDS, SKEDS, SKEDS !!!
For the Locals without CW/SSB I will have 146.55 and 446.00 FM.
I'm open to any skeds from Tropo to Random Meteors Sunday morning.
Needing 11 grids to finish 432 VUCC I'm especially looking for UHF Qs
from N.CA, UT, ID, and OR. Another goal is to finally work AZ on 2M
Tropo from here. Is anyone down that way going to be portable in the
N.W. corner of the state?
Heres to NO SNOW or WIND! HI!! 73s and CUL on the air. sk
de Tim.Marek@Megasystem.Com

SB SAT @ AMSAT $ANS-246.01
WISP DOWNLOAD STEPS FROM DRIG

HR AMSAT NEWS SERVICE BULLETIN 246.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 3, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-246.01

How To Download The AMSAT WISP MICROSAT Telemetry Program

The Dallas Remote Imaging Group (DRIG) BBS will carry the latest updates
to the WISP Microsat packet radio programs on the system. Roy Welch (W0SL)
will be uploading both the entire package and the Dynamic Link Library (DLL)
updates to DRIG as soon as the executables are available.

The WISP files will be available to all users, even brand new members who
have not yet fully registered.

To find the latest version, log on to the DRIG BBS in Dallas at:
214-394-7438

Your communications program parameters should be:
28.8Kbps to 2400 bps (1200 is too slow and not supported)

N parity
8 data bits
1 stop bit

Log on and if you are a new user, answer Yes to Register with us (if you
answer no, you will not be able to download files). Answer the requested
information (type in your own first name, last name, password, city, state,
full address, telephone, etc) for our database for any new mailings or
postings you would be interested in.

>From the Main Menu, do the following:

Z WISP 7

The Z is a Zippy search to find the character string WISP

7 is the Microsat telemetry program files area

A listing of all of the WISP programs in File Areas 7 (Microsats)
will be displayed.

Picked the NEWEST one by the name WISPNEW.ZIP

Pick up only the latest changes by the name WISPUPDT.ZIP

Use Zmodem or any other binary protocol to download!

You may download the file from the Main menu by typing the
following:

D WISPNEW.ZIP (type in this WISP filename for a new complete file)
D WISPUPDT.ZIP (type in this WISP filename for the lastest updates only)

If it asks for a Protocol, the fastest is Zmodem (xmodem, ymodem, kermit,
also work o.k.)

The system will come back with a listing of files you want to download.
Just hit enter, and if you want to log off immediately after the download
is complete, simply type G for goodbye in the command line when asked.

==========

BULLET90 is the file to download for NASA 2-line Keps (updated weekly)

BULLET93 is the file to download for AMSAT style keps (updated weekly)

If you get industrious, also download the DRIG informatin file:
DRIGINFO.ZIP and DRIGLIST.ZIP which is a COMPLETE listing of all
7 gigabytes of files on the DRIG BBS! And of course, any problems, simply
enter C for Comment to Sysop and will will be glady to help you out!

Dallas Remote Imaging Group
Satellite Imagery BBS

AMSAT-NA SPACE SYMPOSIUM AGENDA

HR AMSAT NEWS SERVICE BULLETIN 246.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 3, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-246.01

AMSAT-NA Space Symposium & Annual Meeting Scheduled For 7-9 Oct '94

1994 AMSAT-NA Annual Meeting
and Space Symposium
Holiday Inn, Orlando International Airport, Florida
October 7-9, 1994

Friday, October 7, 1994
11:00 - 5:00 PM Registration - International Ballroom Entrance
1:00 - 5:00 PM Session A - Mission Status Briefings - International Ballroom
1:00 - 1:30 PM Frank Bauer: "SAREX Update '94"
1:30 - 2:00 PM Joan Freeman KD4SRD: "A SAREX Case Study"
2:00 - 2:45 PM Dennis Wingo KD4ETA: "SEDSAT1 Update SEDSAT2; Amateur
Radio in Lunar Orbit"
2:45 - 3:00 AM Break
3:00 - 3:30 PM Dan Schultz N8FGV: "Hubble Space Telescope Photographs"
3:30 - 4:00 PM Robert Diersing N5AHD: "DOVE Back On the Air"
4:00 - 4:30 PM David Liberman XE1TU: "UNAMSAT: An Operational Guide"
4:30 - 5:00 PM Philip Chien KC4YER: "Launch Opportunities Beyond Phase-3D"

Saturday, October 8, 1994
7:30 - 8:00 AM Registration - International Ballroom Entrance
8:00 - 11:45 AM Session B - Orbital Science and Systems - International
Ballroom
8:00 - 8:05 AM Bill Tynan W3XO: "Welcome & Introduction"
8:05 - 8:10 AM Al Brinkerhoff WB5PMR: "Symposium Opening Remarks & Orientation"
8:10 - 9:00 AM Prof. Robert Twiggs: "Investigating the Integrated Control of
Payloads: The Stanford SQUIRT MICRO-
Satellite Program"
9:00 - 9:30 AM Keith Pugh W5IU "Quiktrak for Windows"
by Bob McGwier N4HY
9:30 - 10:00 AM Tom Clark W3IWI: "Where Am I and What Time Is It?"
10:00 - 10:15 AM Break
10:15 - 10:45 AM Walter K. Daniel KE3HP: "Use of Star Cameras for
Attitude Determination of
Amateur Radio Satellites"
10:45 - 11:15 AM Doug Loughmiller KO5I "UoSAT: The Successful
Evolution..."
11:15 - 11:45 AM Greg Jones WD5IVD: "The TAPR/AMSAT DSP-93 Project"
with Bob Strickland N5BRG,
Robert Diersing N5AHD, and
Frank Perkins WB5IPM

11:45 - 1:00 PM Lunch Break

1:00 - 5:00 PM Session C - P3D Design Review - International Ballroom
1:00 - 1:05 PM Bill Tynan W3XO: "Phase 3D; A New Era for Amateur Satellites"
1:05 - 1:35 PM Dick Jansson WD4FABP3D "Mechanical and Thermal Design"
1:35 - 2:05 PM Dr. Karl Meinzer DJ4ZC: "P3D RF Subsystems and Attitude Control"
2:05 - 2:30 PM Stan Wood WA4NFY: "Antenna Designs of the P3D Spacecraft"
2:30 - 2:45 PM Lyle Johnson WA7GXD: "The P3D IHU and RUDAK-U"
2:45 - 3:00 PM Peter Guelzow DB2OS: "The P3D RUDAK-E"
3:00 - 3:15 PM Break
3:15 - 3:30 PM Dick Daniels W4PUJ: "The P3D Propulsion System"
3:30 - 4:10 PM Tom Clark W3IWI: "The P3D GPS Experiment"
4:10 - 4:20 PM WA1UVP & W3IWI: "The P3D GPS Hardware"
4:20 - 4:30 PM N3EUA,KD9KX,WA7GXD: "The P3D GPS Computer System"
4:30 - 4:40 PM W3IWI, WA5FXE: "The P3D GPS Antennas"
4:40 - 4:55 PM Doug Loughmiller G0SYX: "AMSAT-UK Contributions to P3D"

4:55 - 5:00 PM Steve Park WB9OEP: "Symposium Concluding Remarks"

6:00 - 7:00 PM Social Hour and Cash Bar - International Ballroom Lobby
7:00 - 11:00 PM Banquet and Annual Meeting - International Ballroom
Speaker: Dr. Paul Shuch N6TX, "The Search for Dark Matter"

Sunday, October 9, 1994
7:00 - 9:00 AM Area Coordinators Breakfast - Continental Room
9:00 - 2:00 PM Bus Tours to the P3D Integration Facility
10:00 AM Open Board of Directors Meeting - Continental Room
9:00 - 1:30 PM Session D - Satellite Operating - International Ballroom
9:00 - 9:30 AM Keith Baker KB1SF: "Beginners Forum"
9:30 - 10:00 AM Robert Diersing, N5AHD: "Examination of AO-16 and UO-22 Activity"
10:00 - 10:30 AM Dr. Paul Shuch N6TX: "Orbital Analysis by Sleight of Hand"
10:30 - 11:15 AM Ed Krome, KA9LNV: "Basics of Mode-S Operation & Feeds for Mode-S Dish Antennas"
11:15 - 11:45 AM Doug Varney WA1UVP: "MMICs at S-Band"
11:45 - 12:15 PM Gould Smith WA4SXM: "Beginners Guide to Radio Sputniks"
12:15 - 12:45 PM Ned Stearns AA7A: "A Major Field Day Satellite Operation"
12:45 - 1:00 PM Roy Welch W0SL: "AMSAT Software"
1:00 - 1:30 PM John Hansen WA0PTV: "Software for the Digital Birds"

Note: Eligibility for prizes and attendance at the Annual Meeting does not require purchase of a Banquet Ticket.

Registration and information about hotel rates and discounts can be obtained by calling AMSAT-NA Office Manager, Martha Saragovitz (NOCALL) by phone or writing to:
AMSAT
850 Sligo Ave., Suite 600
Silver Spring, MD 20910
Telephone: (301) 589-6062
FAX: (301) 608-3410

Don't delay in making your reservations and registering for what will be a great AMSAT Symposium!

SB SAT @ AMSAT $ANS-246.03
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 246.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 3, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-246.03

Weekly OSCAR Status Reports: 27-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12

Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

AO-16: AO-16 is working well. [WH6I]

KO-23: KO-23 is working well. [WH6I]

KO-25: KO-25 seems again to be in one of its "deaf" modes. The BBS seems to be there but WH6I can't seem get it to respond at all and he never sees anyone in the link. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

(I apologize in advance if readers feel that their newsgroup was not appropriate for this post. I picked the closest three I could find; feel free to email me if you think I should add or delete a newsgroup name from the newsgroup's line. (one companies name showed up in GPS world (hence sci.geo.satellite-nav)).

I would like to know the names and addresses (or phone numbers) of all companies that are planning low earth orbit communications systems. The following incomplete list has the ones I am familiar with so far, if anyone knows of any others please email me and I'll post an update later. Thank you.

Little LEO (data only) Project Name
---------------------- ------------
Orbital Communication Corp. ORBCOMM
Fairfax, Va.

Starsys Inc. Starnet
Lanham, Maryland

Big LEO (voice and data)

Motorola Inc. Irridium
Chandler, Arizona

TRW Inc. (This system is more medium earth orbit) Odyssey
Redondo Beach, California

Loral/Qualcomm Globalstar

dara parsavand who would be ecstatic to have a PET (Portable
parsavan@prony.colorado.edu Email Transciever), but is still waiting

=========
SpaceNews
=========

MONDAY SEPTEMBER 5, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* SKY WATCH *
=============
In September's evening twilight, Saturn shines in the east-southeastern sky just above the horizon. By nightfall it is fairly high and bright, appearing as a golden point of light to the naked eye. Because Saturn is closest to Earth this year, it will attain a magnitude of 0.5, located in the constellation of Aquarius. Saturn may also be found by looking for the bright star of Formalhaut in the constellation of Piscis Austrinus which has a magnitude of +1.2. A small telescope will reveal the complex system of orbiting rings and moons. The largest moon, Titan, appears as an 8th magnitude point near the planet. Also Saturn's rings are now only 7 degrees from being edge on as seen from here on Earth.

Near the bright star, Spica, one can find Venus shining at a magnitude of -4.4 when the month begins. On the evening of September 8, Venus and the young Moon will pass each other in the western evening sky. On the evening of September 20, Venus wil reach it's greatest brilliancy at a magnitude of -4.6. If Venus is seen through a telescope, it will be found to be in a wanning crescent during it's brightest, showing us here on Earth, only half of it's brilliancy.

Jupiter is finally getting a rest after the tremendous impacts it suffered in July from the fragments of Comet Shoemaker-Levy 9. But Jupiter is still the second brightest planet after Venus, shining at a magnitude of -1.8 and can still be seen in the constellation of Libra. On September 1, Jupiter can be found about 15 degrees to the upper left of Venus and as the month passes, Jupiter will slide toward Venus in the western twilight sky. On September 9, Jupiter will be near the young crescent Moon. Watch for Venus, Jupiter, and the Moon on the evening of September 8 as the three approach each other. This will be a fine view for the astrophotographers who specialize in planet combinations.

Mercury can be found in the evening sky this month, but will remain very close to the horizon. Because Mercury will be so close to the horizon, it will probably be hidden from view this month.

Pluto can be found in the constellation of Libra and is in the southwestern sky just after sunset. But it shines at a magnitude of +13.8, so it will take a telescope of at least 8 inches to see the tiny point of light in the dark sky.

Uranus and Neptune, magnitudes 5.7 and 7.9, lie in the south after sunset during September in the rich starfields of Sagittarius.

Mars is the only planet that will rise a couple hours before dawn this month, in the eastern sky. On September 1 the wanning crescent Moon will be just below Mars.

* MIR NEWS *
============
The Mir space station apparently suffered no hits from the recent Perseid meteor shower. Several particles collided with the space station during last year's meteor shower.

The PROGRESS-M24 freighter was scheduled for launch Baykonur on 25-Aug-94 at 1425 UTC. Listeners in Western Europe were alerted listen for transmissions related to this launch on the known frequencies (166.140, 166.130, 165.874 and 922.755 MHz +/- Doppler) 3 hours after liftoff.

Instead of 4, only 2 EVAs will be made by Malenchenko and Musabayev. These EVAs are scheduled for the 8th and 12th of September 1994. Their purpose is to transfer solar panels from the Kristall to the Kvant-1 module.

The launch of Specktr (Module-O) has been delayed once again. Now there is word that the launch will take place in May 1995. Undoubtedly, this will also mean that the launch of Priroda (Module-E) will be put back too.

The schedule for American flights to Mir might need to be changed due to Spektr launch delay. No further details are available as of yet.

[Info via Chris v.d. Berg, NL-9165/A-UK3202]

* MORE MIR NEWS *
==========
Ascending nodes of Mir are currently taking place almost directly under the Sun. It is crossing the terminator close to its extreme northern and southern latitude excursions. As a result, Mir will be visible shortly before sunrise in the southern hemisphere, and shortly after sunset in the northern hemisphere for the next few weeks. Consult your favorite satellite orbital prediction software for the exact times for your location.

* SAREX NEWS *
==========
The STS-64 Space Shuttle Discovery Mission, tentatively scheduled for launch on September 9 at 20:30 UTC, will carry SAREX voice and packet radio on a 9 day mission. STS-64 will carry the Lidar In-Space Technology Experiment (LITE-1), the SPARTAN-201, and the Robot Operated Materials Processing System (ROMPS) experiment in addition to SAREX into a 57 degree inclination orbit.

Amateur Radio operators on Discovery include Dick Richards, KB5SIW, Commander, Blaine Hammond, KC5HBS, Pilot, and Jerry Linenger, KC5HBR, Mission Specialist. Primary callsign for FM voice contacts will be KB5SIW, while W5RRR-1 will be used for packet radio contacts. All operations will utilize separate uplink and downlink frequencies. DO NOT TRANSMIT on the downlink frequency!

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
(Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: the crew will not favor any specific uplink
frequency, so your ability to work the crew will
be the "luck of the draw"

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

The Goddard Amateur Radio Club station, WA3NAN, in Greenbelt Maryland will be active and carry SAREX Bulletins and Shuttle Retransmissions on 3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz and 147.450 MHz (FM).

The following Keplerian elements have been rotated to the current planned launch time of Sep 9 at 20:30 UTC. The JSC-005 epoch is at the start of orbit 5, after the trim burns on orbits 3 and 4. The negative drag fit was

required to match the design trajectory because there is a 6.5 fps trim burn
on orbit 28. The phasing and circ burns on orbit 99 lower the altitude by
about 8 n.mi, so the second element set JSC-006 is required after that.
These Keps are provided by Gil Carman, WA5NOM at the Johnson Space Center
ARC.

STS-64
1 00064U 94253.10077961 -.00030838 00000-0 -39665-4 0 59
2 00064 57.0058 195.1865 0009670 275.6619 84.3358 16.05979206 51

Note: This element set (JSC-005) is valid for orbits 2 through 98.
Use JSC-006 (below) after 15 Sep 94, 22:51:30 UTC (MET 6/03:49:30).

STS-64
1 00064U 94259.01448182 .00096406 00000-0 94275-4 0 62
2 00064 57.0059 167.2656 0009343 269.2157 90.7841 16.11240267 1002

Note: This element set (JSC-006) is valid for orbits 99 through 142.
Use JSC-005 (above) before 15 Sep 94, 22:51:30 UTC (MET 6/03:49:30).
The deorbit burn is scheduled for 18 Sep at 15:40 UTC (MET 8/20:38).

Notes:

. % : transmitter outage during the whole hour or a part of it. Low counts indicate that no other interference, which could be confused with meteors, is picked up.
Few transmitters are broadcasting between 2h-4h local time (Sat-Sun 3h-5h local time) or sometimes longer. (When summer hour is in use: local time = UT + 2h).

. & : manually eliminated for direct reception.

. The Perseids' new peak can be seen in the daytime data of Aug 12 between 8 h and 12h UT. Its intensity is lower than last year.
This period of high activity is confirmed by Paul Vauterin, based on the observations at the University of Ghent, as well as by several radio-amateurs:

"Maximum was on 12 August between 8h UT and 13 h UT.
Jacques ON4AVJ (Belgium)."

"Max activity during diurnal(?) peak, 12 Aug, around 11h00-11h30 UT.
Silvio IW1AZJ (Italy)."

"The 1st maximum seems to be at 12 Aug 09h-11h UT.
A second peak was around 12 Aug 22h UT to 13 Aug 04h UT.
Guido DL8EBW (Germany)."

"For me the best activity was around 11h00 UT 12 Aug 1994.
Jacob IC8FAX (Island of Capri)."

Peter Brown reported a visual outburst on August 12, lasting from 9h30 UT
to 11h00 UT (IAU Circular 6052 of Aug 12).
The classical Perseid maximum took place on Aug 13 at 3h UT.

M. De Meyere / C. Steyaert

2. PUBLICATION

" World Radio & Television Handbook", 1994 edition,
edited by Andrew G.Sennit, 599 pp., softbound.
1994 Billboard Books, ISBN 0-8230-5925-1, price approx 45 USD.
BPI Communications, 1515 Broadway, New York 10036, NY, USA.

This book contains country-by-country listings of long, medium and
shortwave transmitters by frequency, time and language. Addititionally it
provides the reader with information about:

. world satellite broadcasts;
. addresses of broadcasting organizations and DX Clubs;
. receiver test reports.

This book appears annually and is the major information source for
identifying FM stations contributing to forward scatter.

Jeroen Van Wassenhove

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio
meteor scatter observations and data reduction. It started in August 1993
in order to spread rapidly the Perseid results via E-mail. Since then, it
has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of
stream activity by radio methods, relations between radio and optical meteors,
references to other publications in the field of meteor astronomy and radio
scatter techniques, announcements of meetings, short questions and answers,
non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them
directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should
indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list,
please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge
from J. Van Wassenhove (current or backissues).

1363. Re: Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-09-06 19:59:32 UTC
From: paul@hooker.demon.co.uk
Message-ID: <778881572snz@hooker.demon.co.uk>
Source record: 26966

Hopefully a simple question ..

Could someone point me to some source code for converting the standard NASA
2 line element sets into orbital parameters giving :

inclination (I know, in the 2line data!)
period
apogee
perigee

There must be some information/source code somewhere on the net showing how,
but I haven't found it yet.

Thanks,

Paul

1365. Beginners list

Newsgroup: rec.radio.amateur.space
Date: 1994-09-07 02:23:11 UTC
From: Andrew Naylor <anaylor@delphi.com>
Message-ID: <ZU+zmfv.anaylor@delphi.com>
Source record: 26969

I was wondering if there is a list of all the operating, amateur radio satellites along with a short description about modes, freqs. etc. I have made a few contacts on Mir, RS10/11, and RS12/13 but that's about it. Thanks in advance. N0UJT

Until recently, NASA Select Audio was retransmitted on
the WD8OXB Repeater, 145.410, in Commerce Township.
Lately, though, I have noticed a distant Canadian ID
on that frequency, and WD8OXB's machine appears to be
down.

Voyage Through The Solar System"

A full- motion Journey through the heavens.

Age: 8 to Adult/ General Reference

Voyage Through The Solar System" is already winning accolades from across the country. The director of the Texas Space Camp rates this CD-ROM as the best new space title. The wonders of our solar system are presented in extraordinary detail with over 70 JPL/NASA movies, full narration and original music and slide shows.

This easy to use disk also has generous amounts of text , data and astronomical expert accounts providing hours of interactive entertainment and learning. Just point and click. The program operates on either PC Windows or Mac.....all on the same disc.

Each planet in our solar system is detailed with actual JPL/NASA probe photographs and one of the largest collection of full -motion videos and animation's ever compiled on one CD. You'll also find detailed information on each planet's moons, scientific discoveries, comets and the asteroid belt all in an easy and fun to use interface.

System requirements:

PC Windows, 386 or higher, minimum of 4 mb of RAM, 640x480 256 color VGA graphics card and monitor, MPC-compatable sound card. Double speed drive recommended
Macintosh: LC11 or higher with 8 bit or higher color display, 5 MB of RAM. Double speed drive recomended.

Price: $49.95 (we pay all air shipping and handling charges)
send check or money order to:

1371. STS-64 MacSPOC Checkpoint #0

Newsgroup: rec.radio.amateur.space
Date: 1994-09-08 02:38:39 UTC
From: tstader@si.tiac.net
Message-ID: <tstader-0709942238390001@si.tiac.net>
Source record: 26975

MacSPOC Users-

The enclosed checkpoint will become valid at 0/04:48 MET following an ontime, nominal STS-64 launch Friday, September 9 at 3:30 PM CDT. The checkpoint reflects prelaunch planning for 2 small trim burns executed shortly beforehand and should be approximately correct following the OMS-2 burn at 0/00:38 MET.

The prime end-of-mission deorbit opportunity is to KSC on Orbit 158 at 9/19:06 MET, with landing on Orbit 159 at 9/20:01 MET, or 11:31 AM CDT, Monday, September 19. Discovery's primary STS-64 payload is the LIDAR In Space Technology Experiment (LITE). Operating at both visible and invisible wavelengths, LITE will beam laser energy earthward from Discovery to detect scattered or reflected signals from the ground, clouds, and atmospheric particles using a 1-meter telescope in the payload bay. The success of LITE will have important implications for the atmospheric sciences, particularly meteorology.

Although visible laser pulses could damage the eye if viewed through telescopes with apertures larger than 6 inches, this hazard is considered remote. It is only present under clear skies for an observer located within the laser's beam width. On the ground, this beam width is about 1000 feet in diameter, with successive pulses spaced about every 2400 feet. As a precaution for the astronomical community, NASA will be posting detailed STS-64 trajectory information to the sci.space.shuttle Internet news group.

At approximately 3/23:15 MET, Discovery's crew will release the Shuttle Pointed Autonomous Research Tool for Astronomy 201 (SPARTAN 201) satellite from the Remote Manipulator System (RMS). The sun's corona will be studied by SPARTAN 201's instruments at ranges up to about 100 nm from Discovery until it's retrieved around 5/22:30 MET.

From 6/16:30 to 6/22:30 MET, an EVA is planned to evaluate the Simplified Aid For EVA Rescue (SAFER) backpack. With SAFER's propulsion and control capabilities, it will be possible for EVA crewmembers to perform small untethered maneuvers in Discovery's payload bay.

Among the many STS-64 secondary payloads is the Shuttle Amateur Radio Experiment (SAREX). Contacts with schools and amateur radio operators worldwide are to be made using licensed crewmembers or a "robot" mode in which earthbound calls are automatically acknowledged, then logged aboard Discovery.

MacSPOC v1.5 users will want to make note of a TDRSS configuration change tentatively planned from about 7/01:45 (Orbit 114) to 8/03:05 (Orbit 131)

MET. Since MacSPOC v1.5 was published early last year, nearly all Shuttle operations have been supported by TDRSS elements stationed at 174 W and 41 W longitude. During this period, however, support will come from elements at 171 W and 46 W. This will lengthen the Zone Of Exclusion (ZOE) loss of contact with Discovery by a couple minutes. To follow the current TDRSS configuration during STS-64, be prepared to select "GeoSat Status..." from MacSPOC's "Update" menu. Refined TDRSS support schedules will be uploaded if they become available for release during the mission.

Does anyone know of a mail order outlet with RCA DSS systems in stock?
I live in St. Louis and the systems might not be available until the
first of the year. I'm anxious. Thanks,

Stu

1375. PB Setup..help

Newsgroup: rec.radio.amateur.space
Date: 1994-09-08 21:21:09 UTC
From: tsmithers@cix.compulink.co.uk
Message-ID: <Cvtxz9.Iww@cix.compulink.co.uk>
Source record: 26979

I have been trying to set up PB for reception of Oscar 16, so far without
much success.
The modem is a PSK-1T set with Parity 0,Awlen 8, Kiss on. The PSK is set
to Man,USB, PSK on, 9600bd...PC is also set to 9600.
Using Procomm+ this arrangement seems to work in that I can receive some
of the data from O16, and shows that signals are getting from the modem
to the pc. However I cannot get any response from PB.
PB.cfg is as follows,

```
mycall G0KTN
bdcstcall PACSAT-11
port 2
speed 9600
restart_delay 60
txd 150
graball 1
kisstnc 1
```

Can anyone see what I've missed..advice would be appreciated.

SETIQuest is a new quarterly print/electronic mail (E-mail) periodical containing news, technical information, and tutorials devoted to bioastronomy and its subset, SETI (Search for Extraterrestrial Intelligence).

SETIQuest is published for professionals, serious amateur astronomers, and individuals curious about this fascinating field of observation. SETIQuest fills the need for a specialized astronomical publication devoted exclusively to the on-going search for evidence of life in the Universe. Such evidence could be intentional or inadvertent signals of other civilizations. Such evidence could be found in spectral signatures of biological activity on extrasolar planets or in the interstellar medium.

SETIQuest is written and edited for the scientifically literate individual taking part in the progress of our technological civilization, with articles by amateur and professional scientists. SETIQuest includes information about hands-on observational programs that can be carried out by individuals and groups of amateur astronomers at radio and optical wavelengths.

SETIQuest is filled with articles covering topics such as:

* Tutorials about bioastronomy and SETI
* Microwave or optical SETI as practiced by amateurs
* "Do-it-yourself" participation in bioastronomy and SETI activities
* Book reviews
* Regular commentary on issues relevant to SETI and bioastronomy:

SETI and the political milieu

Philosophical issues regarding the prospects of success and failure in the search

SETI as a parable of science versus pseudo science

Publications Watch: Summaries of recent scientific/general publications relevant to SETI

For your FREE issue of SETIQuest (Volume 1, Number 1), send us your postal address by fax, E-mail, or conventional mail to:

1380. WISP

Newsgroup: rec.radio.amateur.space
Date: 1994-09-09 16:59:36 UTC
From: Ron.Parsons@f40.n382.z1.fidonet.org
Message-ID: <779155296.AA01308@afarm.uucp>
Source record: 26984

WiSP is a Windows satellite pacsat tracking and data upload/download engine,
among other things. It is available on DRIG in Dallas.

=========
SpaceNews
=========

MONDAY SEPTEMBER 12, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* SpaceNews EDITOR ON WWCR *
============================
Mark you calendars and warm up your receivers for a ive radio interview
with the man behind the SpaceNews keyboard, John Magliacane, KD2BD. The
producers of "Spectrum", a radio program broadcast over shortwave radio
station WWCR, on 5810 KHz, in Nashville, Tennessee will feature an interview
with the editor and publisher of SpaceNews on Sunday 11-Sep-94 from 0300
to 0400 UTC (that's Saturday 10-Sep-94 10:00 PM to 11:00 PM Eastern Time).

"Spectrum" is a communications program that originates live from studios
in Holmdel, New Jersey, and features news and information regarding
shortwave listening, commercial broadcasting, scanning, and Amateur Radio.
During the interview, listeners will be given the opportunity to call into
Spectrum and ask questions of the guest.

WWCR broadcasts on shortwave with 100 kilowatts of transmitter power, over
1 million watts of effective radiated power, and provides a signal that
covers much of the world. In addition, those with TVRO ground stations can
receive "Spectrum" on the Galaxy 5 satellite, transponder 17, audio 5.8 MHz.

* FO-20 RETURNS TO MODE JD *
============================
FO-20 software reloading was successfully completed on 06-Sep-94 at
1800 UTC and FO-20 was commanded into mode JD. The following packet
frames were captured by KD2BD in New Jersey last Monday:

8J1JBS>BEACON <UI C>:
JAS1b RA 94/09/05 20:06:58
428 442 674 678 730 817 835 821 000 673
608 000 463 482 503 487 497 507 645 000
670 704 655 662 999 635 865 490 018 000
010 101 000 001 111 100 001 111 011 000

8J1JBS>BEACON <UI C>:
JAS1b M0 94/09/05 20:07:00
Mailbox is at your service from 94/09/05 05:10:00
The JD Transmitter is available in all orbits
during JD mode.

The mailbox is also in operation. Congratulations go to the spacecraft controllers for returning FO-20's digital transponder back to life after it had been reported as being lost forever.

Ground stations are encouraged to copy telemetry transmissions made by the satellite, and forward telemetry frames to the spacecraft controllers if the on-board computer should crash once again.

[Info via Kazu Sakamoto, JJ1WTK]

* HV AND T7 ON AO-13 *
==========
It's time for Eric Archer, WB6GYD, to take another trip to the lovely country of Italy. Eric plans to be in Rome the period of September 14-28 and will operate from the following locations:

HV3SJ Vatican City: Sept. 17/18
T70A Republic of San Marino: Sept 24/25

The operation at HV3SJ may not result in AO-13 contacts as Eric does not yet have permission to operate in the middle of the night. So at this point in time, AO-13 is questionable for HV3SJ. Eric will operate HF instead (if not satellite). HV3SJ now has a permanent FT-736R, 435 MHz Mirage amplifier and Landwehr LNA at their station. (FT-736R donation is courtesy of Yaesu USA, THANK YOU!!) Eric plans to help install some yagis to complete their permanent station.

Eric has permission to operate in the middle of the night at the RSM Radio Club location, so the operation there is definate. He will either sign as T70A or as T7/WB6GYD. Look for Eric at approximately 0000Z to 0500Z on Sept. 25. This seems to be the best operating time for AO-13.

[Info via Eric Archer, WB6GYD]

* W2YLV SK *
==========
John Snodgrass W2YLV has passed away. He was active on AO-10 & AO-13 CW. It is unclear whether John kept any skeds with people on AO-13, but this notice is for all his friends on AO-13. John was in his 70's and died of heart problems. He will be missed, especially by his friends on the radio.

[Info via Len Popyack, WF2V]

* THANKS! *
==========
Thanks to all those who sent messages of appreciation to SpaceNews, especially:

SB SAREX @ AMSAT $STS-64.001
STS-64 SAREX Liftoff

Silver Spring, MD, September 9 1994 at 21:00 EDT

The Space Shuttle Discovery roared into the skies of the Kennedy Space Center today initiating the fourth Shuttle Amateur Radio Experient (SAREX) flight this year. The STS-64 mission, delayed by looming showers and clouds, was launched 1 hour 53 minutes later than originally planned. Liftoff of Discovery occurred at 22:22:55 UTC. The six member crew of STS-64 will spend 9 days on-orbit performing and supporting several flight experiments. These include atmospheric studies which will be performed using the LIDAR In-Space Technology Experiment (LITE), deploying and retrieving the Spartan-201-II astronomy satellite, and supporting the Robot Operated Materials Processing System (ROMPS) experiment.

Three of the crew members are ham radio operators. They are Shuttle Commander Dick Richards, KB5SIW, Pilot Blaine Hammond, KC5HBS, and Mission Specialist and Jerry Linenger, KC5HBR. The three will operate the SAREX in both voice and packet modes. SAREX is a secondary mid-deck payload that allows ham radio operators and school students the opportunity to talk to the astronauts while they are in orbit. Ten scheduled school group contacts with students in the US and New Zealand are planned. The SAREX Working Group expects the SAREX payload to be configured and operational approximately 22 hours into the flight or at approximately 20:22 UTC on September 10. Please note that Shuttle power conservation measures, required to support an extra (10th) day of flight, is expected to result in the packet radio system being turned on later than what usually occurs in a typical SAREX mission. Listen on the downlink frequency (145.55 MHz) for the packet system BEFORE sending packet connects to the Space Shuttle.

The following Keplerian element set, JSC-012, which was developed by Gil Carman, WA5NOM, is the official SAREX element set for today.

RA of node: 223.4928 deg Space Shuttle Flight STS-64
Eccentricity: .0009244 Keplerian element set JSC-012
Arg of perigee: 269.5211 deg Launch: 09 SEP 22:22:55 UTC
Mean anomaly: 90.4820 deg
Mean motion: 16.05202670 rev/day Gil Carman
Decay rate: 8.3204e-04 rev/day^2 NASA Johnson Space Center
Epoch rev: 5
Checksum: 263

These elements will propagate to match the nominal planned trajectory
with respect to Mission elapsed time, and have been adjusted to
reflect the actual launch time of 22:22:55.

S H U T T L E V E C T O R D A T A

Below is the rev 1 Earth-Fixed Greenwich (EFG), State Vector for STS-65.
This vector comes from NASA Goddard Space Flight Center (GSFC) and is
provided courtesy of the DOD C-Band Radar Network.

The data between the dotted lines may be read directly by VEC2TLE to
estimate
the Keplerian Elements for STS-64 in NASA Two-Line (TLE) format. The
VEC2TLE
software is available from a variety of sources including AMSAT-NA, the NASA
Spacelink BBS (205) 895-0028 and at the following Internet FTP address:
oak.oakland.edu:/pub/msdos/hamradio/v2l9331.zip -- VEC2TLE may be
registered
free of charge for hobby use.

.....
Vector format = 117
Satellite Name: STS-64
Catalog Number: 23251 94059A
Epoch Date/Time: 94252.95914359954
09/09/1994 23:01:10.006 UTC
EFG E: 9455000.23 ft
F: 19240089.33 ft
G: 3826309.31 ft
Edot: -9573.6334 ft/s
Fdot: 8859.0737 ft/s
Gdot: -20863.2123 ft/s
ndot/2 (drag): 0.00072371545 rev/day^2
nddt/6: 2.17448E-08 rev/day^3
Bstar: 9.81345E-05 1/Earth Radii
Elset #: 1
Rev @ Epoch: 1.46635786768
.....

The drag values are estimated by VEC2TLE using a 1.0 drag multipier.

To create a file for use by VEC2TLE, simply write the data between the
dotted lines to a new (text) file. I recommend that the file you save
have a .VIF extension (default for VEC2TLE vector input files).

MSDOS/PC software is available for conversion of
OSV to 2 Line Keplerian Elements via ftp to:
oak.oakland.edu:/pub/msdos/hamradio/v2l9331.zip
and the SIMTEL archives.

State Vectors courtesy Ken Ernandes N2WWD

1385. Two-Line Orbital Element Sets (TLE464)

Newsgroup: rec.radio.amateur.space
Date: 1994-09-10 02:15:21 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.779163321@afit.af.mil>
Source record: 26987

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

SB SAREX @ AMSAT $STS-64.002
SAREX Info Sheet

STS-64 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission: STS-64 Space Shuttle Discovery
Lidar In-Space Technology Experiment (LITE-1)
SPARTAN-201
Robot Operated Materials Processing System (ROMPS)

Launch: September 9, 1994, 22:22 UTC

Orbit: 57 degree inclination

Mission Length: 9 days (Nominal)

Amateur
Radio
Operators: Dick Richards, KB5SIW, Commander, Blaine Hammond, KC5HBS,
Pilot, and Jerry Linenger, KC5HBR, Mission Specialist

Modes: FM Voice
Prime callsign: KB5SIW

Packet Radio
Callsign: W5RRR-1

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
(Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: the crew will not favor any specific uplink
frequency, so your ability to work the crew will
be the "luck of the draw"

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins
3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz
and 147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS,
Compuserve, and your local PBSS.

School Group Participation: 10 school groups will participate
in SAREX with pre-scheduled direct
and telebridge contacts. These include
nine in the U.S., and one in New Zealand.

QSLs: ARRL Headquarters
SAREX QSL (please indicate flight #, STS-XX)
225 Main Street
Newington, CT 06111
This address must be used for all future missions.

In order for the managing process to run smoothly, please include
the following information in your QSL or report: Shuttle flight
nur (STS-XX), date, time in UTC, frequency and mode (FM voice,
packet, sstv or fv). This documents the contact or listener
report. In addition, you must also include an SASE using a large,
business-sized envelope you wish to receive a card. No cards
are distributed without the proper post affixed or sufficient
IRCs included.

The following clubs have graciously volunteered their service for
handling QSL cards for the following missions:

STS-58 Connecticut DX Association
STS-60 Cowley County Amateur Radio Club, Kansas
STS-59 Orange Park Amateur Radio Club, Florida
STS-64 Nashua Area Radio Club, New Hampshire

Information provided by Frank H. Bauer, KA3HDO and Robert Inderbitzen, NQ1R

Subj: MIR INFO REQUESTED

Hello everyone,

I have been trying to contact the packet radio station on board
the MIR space station. Can someone tell me if and what I am doing
wrong? Lets start with my hardware:

Transmitter is a AZDEN PCS-6000H putting out 45 watts.
Antenna is a 2M vertical 8' above my 2nd story roof.
SWR is 1.4:1
My house is about 20' above sea level with some tall trees in
the front and back yards.
The TNC is a KPC3.

I am transmitting on 144.49 and receiving on 145.55. I am
listening for and attempting to connect to R8MIR-1.

I am running a Tandy 2500 SX/25 with PAKET 6.0 running.

Does anyone have any ideas?

Thnx & 73

de Bob KD4ARD

1390. AOP-2 opinion?

Newsgroup: rec.radio.amateur.space
Date: 1994-09-10 21:10:00 UTC
From: gws@n8emr.cmhnet.org
Message-ID: <1994Sep10.211000.7399@n8emr.cmhnet.org>
Source record: 26994
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

Anyone had a chance to take a look at the cushcraft AOP-2
oscar array? I have the AOP-1 array but have it down for repairs
and figured I might as well update. From the ads I have seen it look like
a couple more elements on 2mters and a much larger antenna on 440.

1391. FTP Site for KEPS??? Help!

Newsgroup: rec.radio.amateur.space
Date: 1994-09-10 22:18:57 UTC
From: briane@goofy.iaccess.za
Message-ID: <34tbch$1pk@goofy.iaccess.za>
Source record: 26995

Thanks for taking the time to read this note.

Due to erratic newsfeeds etc, I am looking for an anonymous FTP site that carries uptodate KEPS for the Amateur interest satellites, STS missions, MIR, Hubbble etc. I would prefer one in the USA, but any site will do.

Please include the /pub/ham/... info if possible, it will save me a lot of logon time (and cost!).

Please e-mail me, or as a last resort post the replies to this newsgroup.

Muchly thanks in advance.

Cheerio,

Brian ZR5DTS Voice: ++27-31-7011201 (06:00-14:30 UTC)

Mir does not run duplex like STS missions do.
Set your X-crv to Xmit AND Rcv on 145.55. At least this was the way they
were set up last time I tried them, and I have connected once.
If they are runing duplex now, sorry for the wrong info.

Keplerian bulletins are transmitted twice weekly from W1AW.
The next scheduled transmission of these data will be Tuesday,
September 13, 1994, at 2230z on Baudot and AMTOR.

S H U T T L E V E C T O R D A T A

Below is the rev 14 Earth-Fixed Greenwich (EFG) State Vector for STS-64.
This vector comes from NASA Goddard Space Flight Center and is provided
courtesy of the DOD C-Band Radar Network.

The data between the dotted lines may be read directly by VEC2TLE to
estimate
the Keplerian Elements for STS-64 in NASA Two-Line (TLE) format. The
VEC2TLE
software is available from a variety of sources including AMSAT-NA and the
NASA Spacelink BBS (205) 895-0028 and may be registered free of charge
for
hobby use.

.....
Vector format = 117
Satellite Name: STS-64
Catalog Number: 23251 94059A
Epoch Date/Time: 94253.75321787037
09/10/1994 18:04:38.024 UTC
EFG E: 10758839.41 ft
F: 6162208.25 ft
G: 17900246.29 ft
Edot: -16911.3224 ft/s
Fdot: 17292.1830 ft/s
Gdot: 4209.6829 ft/s
ndot/2 (drag): 0.00074284453 rev/day^2
nddt/6: 2.29147E-08 rev/day^3
Bstar: 1.02923E-04 1/Earth Radii
Elset #: 4
Rev @ Epoch: 14.21836457971
.....

The drag values are estimated by VEC2TLE using a 1.0 drag multiplier.

To create a file for use by VEC2TLE, simply write the data between the
dotted lines to a new (text) file. I recommend that the file you save
the data have a .VIF extension (default for VEC2TLE vector input files).

MSDOS/PC software is available for conversion of
OSV to 2 Line Keplerian Elements via ftp to:
oak.oakland.edu:/pub/msdos/hamradio/v2l9331.zip
and the SIMTEL archives.

State Vectors courtesy Ken Ernandes N2WWD

SB SAREX @ AMSAT $STS-64.004
STS-64 Eastern R/S Times 09/11

Below are the rise and set times for STS-64 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note
that all times are in UTC.

Rise= time (HH:MM:SS) the Shuttle Orbtiter appears at the horizon
Az= Azimuth (true) where the Orbiter will rise.
Maximum= time, azimuth (Az), and elevation (El) of the highest part
of the pass
Set= time and azimuth when the Shuttle descends below the horizon
Orb= the number of this orbit
Rise MET= The Mission Elapsed Time at the rise. Format is DD:HH:MM:SS

SB SAREX @ AMSAT $STS-64.006
STS-64 Western R/S Times 09/11

Below are the rise and set times for STS-64 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note
that all times are in UTC.

Rise= time (HH:MM:SS) the Shuttle Orbtiter appears at the horizon
Az= Azimuth (true) where the Orbiter will rise.
Maximum= time, azimuth (Az), and elevation (El) of the highest part
of the pass
Set= time and azimuth when the Shuttle descends below the horizon
Orb= the number of this orbit

Rise MET= The Mission Elapsed Time at the rise. Format is DD:HH:MM:SS

Can anyone please direct me where I can get informations about receiving
weather satellites?

Thanks!

Eddie Manalo

Silver Spring, MD September 11, 1994 at 16:30 UTC

Gil Carman, WA5NOM, reports that Element Set JSC-013 is still within 2 seconds of the current orbiter state vector. Since an orbit burn was planned this morning, a new set will probably be provided later today. Therefore, element set JSC-013 is considered the official SAREX set at this time. It is provided below for those who do not have it.

STS-64

AO-16 Command Team To Reload File Server

At 03:00 UTC 12-SEP-1994 the AO-16 Command Team will begin a reload of the Ramdisk and File Server software. This "Preventive Maintenance" is warranted by the accumulation of uncorrectable SEU's (Single Event Upsets) in the file control structures stored on the ram disk. During the past year four uncorrectable SEU's have been recorded in the directory, root directory and FAT (File Allocation Table) entries of the error logs. In the past, a crash of the file server software was attributed to these types of errors. Reloading and running the ram disk software will reformat the ram disk thereby cleaning out all the bad SEU's. Fortunately, these uncorrectable errors are not occurring in the Error Detection And Correction (EDAC) memory where the actual spacecraft operational software is run. This allows the command team to unload and reload a task or tasks with the shortest amount of file server downtime. The digipeater will be off during this reload and all stations are requested not to uplink to the satellite during this time. The AO-16 Command Team would like to thank all AO-16 users in advance for your cooperation during this critical software reloading process.

[The AMSAT News Service (ANS) would like to thank Russ Platt (WJ9F) for this bulletin item.]

AO-10 Condition

Several satellite operators have asked recently about the condition of AMSAT-OSCAR-10 (AO-10).

Jim Kelly (KK3K) provides the information that he heard a strong telemetry beacon Tuesday morning 6-SEP-94 at about 12:00 UTC. It was at about 145.980 MHz and FMing. Jim notes that AO-10 was in the window at the time. He tried transmitting to it and was able to hear himself through the bird, but the downlink signal was extremely weak and FMing was quite noticeable. As a result, Jim discontinued using it immediately.

It should be noted that AO-10's Engineering Beacon is on a nominal frequency of 145.987 MHz. AMSAT-NA advises anyone hearing AO-10 exhibiting this FMing characteristic, to refrain from using it, as Jim did. This is a measure to conserve the satellite's power system. AO-10 may be old and ailing but it's still usable at times. Let's keep it going as long as we can.

Last Chance to Pre-register for the 1994 AMSAT Annual Meeting and Space Symposium

Martha Saragovitz (NOCALL) at AMSAT Headquarters reminds us that time is running short to pre-register for the AMSAT-NA Annual Meeting and Space symposium to be held in Orlando, Florida October 7,8 and 9. To meet the deadline, pre-registrations must be received at the AMSAT office by September 15th. Registrations can be FAXed to: (301) 608-3410.

Anyone needing further information may call the AMSAT office at: (301) 589-6062. A registration form is page 14 of the July/August 1994 issue of The AMSAT Journal.

Weekly OSCAR Status Reports: 10-SEP-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only

Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

FO-20: The long awaited software reloading of FO-20 has completed successfully completed on a pass at about 18:00 UTC on 06-SEP-94 and FO-20 was commanded into its digital mode of operation (Mode-JD). For a while, Mode-JD operation will be continued. However, the FO-20 ground station is concerned that the system may crash when mailbox is activated. The controllers have have noticed some failures of onboard command system during the reloading process. Telemetry reports will be very much apprec-iated if you capture it just before the any crashes. Send your telemetry to Kazu Sakamoto (JJ1WTK) at his INTERNET address of qga02014@niftyserve.or.jp. But in a further status report, KD2BD reports that FO-20 mailbox came back to life over the Labor Day weekend. KD2BD notes that the satellite was sending it's usual ASCII telemetry in AX.25, BPSK, 1200 bps format, and the mailbox was in operation with several active messages. [JJ1WTK & KD2BD]

AO-27: AO-27 has an Uplink frequency of 145.85 MHz FM and Downlink frequency of 436.80 MHz FM. N9AVG reminds everyone that like AO-21, AO-27 operates as part-time repeater. [N9AVG]

IO-26: ITAMSAT Status as of 9-SEP-94: After 40 days of stand-by, ITAMSAT was switched on by ground command and a full spacecraft checkout was performed by the control team. IO-26 was in excellent shape, the battery fully charged and the critical parameters in nominal status. A couple of test software were loaded and executed without any problem. The reason for the long silence is due to the heavy workload of the control team (I2KBD also spent some time in Chile to help the CESAR team) and a lightning that destroyed the main command station. The reload of the Integrated House-keeping Task (IHT) code with improved capabilities is scheduled to be completed by the end of September to celebrate the first year in orbit of IO-26, so expect a couple more weeks of discontinued use. Best regards, Alberto (I2KBD) ITAMSAT Mission Director. [I2KBD]

KO-25: WH6I reports that KO-25 has still been operational this entire week as far as he can tell. [WH6I]

KO-23: WH6I reports that KO-23 is up and running. He wonders if there is a flaw in the directory as he seem to be having a lot of trouble clearing fills for the directory. [WH6I]

AO-16: AO-16 is up and running without any problems. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

The enclosed checkpoint reflects tracking following Trim Burn #3, a 0.6 fps retrograde refinement of Discovery's orbit at 1/04:15 MET. It corrects 12.5 miles of downtrack error accumulated since the last update. The 3 trim burns performed Friday and Saturday are targeting a LITE pass over EDW at 1/10:48 MET required to be at 85 degrees maximum elevation. A fourth trim targeting LITE's pass over NOR at 4/09:02 MET is under evaluation for execution at 1/17:02 MET.

SB SAREX @ AMSAT $STS-64.009
SAREX Status/Keps 9/12 at 11:00 UTC

Silver Spring, MD September 12, 1994 at 11:00 UTC

The SAREX station on the Space Shuttle Discovery was set up by Commander Dick Richards, KB5SIW, and checked out during an Australian pass with Graham Ratcliff, VK5AGR on 9/10 at 20:05 UTC. Since that time, 7 of the 10 the SAREX school groups have successfully completed their scheduled contacts with the shuttle astronauts and several radio amateurs on the ground have had general voice QSOs with the Shuttle Crew.

Several of the school groups have had spectacular horizon-to-horizon contacts with the astronauts with up to 23 questions answered. A total of four schools completed their contacts with the astronauts on 9/10 and three more talked to the crew on 9/11. The first school contact was with the Eisenhower Middle School in Laurel, Maryland on 9/10 at 22:23 UTC. The Goddard ARC, headed by Jim Gass, N3CJN, supported this contact. 11 students asked 22 questions with sufficient time left over for the contact coordinator and teacher to say a few words and ask a question. Rookie astronaut Jerry Linenger, KB5HBR, was at the mike for this contact and was heard to exclaim "Go Navy!!" when he heard that the teacher was heading for the Navy/Virgina football game right after the contact. The Eisenhower contact was quickly followed by a successful contact with students at the Francis Howell Middle School in St. Charles, Missouri and Shuttle Commander Dick Richards, KB5SIW. Ten students were able to ask questions and get responses from Dick during the 7.5 minute contact window. AMSAT people supporting this contact in Missouri included Rusty Baum, WB0QJB, Mike Koenig, Roy Welch, W0SL. Less than one orbit later, the Middleton Grange Middle School in New Zealand had an outstanding contact with Linenger, KB5HBR. 18 questions were answered. The event was covered by all the New Zealand national television services and was retransmitted throughout the country on VHF and on HF. Other school group contacts which have been successfully completed included the Grizzly Hill school in North San Juan, California, the Central Square Middle School in Central Square, New York, the Crystal Lake South Elementary in Crystal Lake, Illinois and the Morocco Elementary School in Morocco, Indiana.

The official Keplerian element set for today is JSC-014 This set, developed by Gil Carman, WA5NOM, at the Johnson Space Center, is provided below.

STS-64

As of a couple of months ago, mail-order DSS was not authorized by RCA.
They're apparently trying to discourage people outside the "trial areas"
from trying it prematurely. You can travel to a distributor in a trial
area and buy one in person, however.

Have you tried the book "Weather Satellite Handbook" by Dr Ralph E
Taggart (WB8DQT), 4th edition, published by ARRL. Costs USD20, I believe.

I found it very good for general understanding of what could be obtained
and what to expect.

1408. MIR Info

Newsgroup: rec.radio.amateur.space
Date: 1994-09-12 15:28:29 UTC
From: lisansky@strauss.udel.edu
Message-ID: <351s2t$hs8@strauss.udel.edu>
Source record: 26861

Mir is simplex on 145.55. The problem with a verticle is there is little
or no signal radiated up. That's what makes a good verticle, a pattern to
the horizon. So here's the catch 22. Your signal is best on the horizon
when MIR is farthest away, and worse when MIR is closest (when straight
overhead). You need to know when MIR comes over the horizon, and try
then. I run Traksat with the Keps updated every time I see new ones.
The MIR orbit changes. I note the time it comes up and sit and wait.
When I hear their signal, I am ready for either packet or voice. When it
gets close to being overhead, I loose them. When they pass, I pick them
up again.
I have to mention this because I see alot of people doing it.
When you see MIR on your screen and they're connected to someone else, DO
NOT try to connect. They can only do one connect at a time, and you'll
only be adding to the QRM. If you interfear with the connected station,
it will take longer for them to do their thing and dissconnect. Most of
the time this means you'll have to wait for them to "time out" with MIR.
By then they'll be gone. Wait untill you see the disconnect message, then
try. We would all get much better results using this method.
Terry

I'm a little new at this. I've been listening for STS-64 for several days now and have heard absolutely nothing. My tracking program seems to be working ok as it agrees with the display I see from NASA Select. I'm listening on 145.55 and xmitting packet on 144.49. I'm using a Isopole or a KLM sat crossed yagi with a Yaesu FT-736. I don't hear a peep on either the the packet radio or the Yaesu. I adjust the vfo upwards to compensate for oncoming doppler and manually adjust the yagi to track the shuttle. I leave computer on listening on 145.55 and not a single packet sqeak is heard.

Any ideas?

Thanks,
Phil, N7FWL

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Bob Stanton said this about: MIR INFO REQUESTED

BS> I have been trying to contact the packet radio station on board
> the MIR space station. Can someone tell me if and what I am doing
> wrong? Lets start with my hardware:

BS> I am transmitting on 144.49 and receiving on 145.55. I am
> listening for and attempting to connect to R8MIR-1.

Transmit and receive 145.550 only. Mir doesn't use a split.

SB SAREX @ AMSAT $STS-64.012
STS-64 Western R/S Times 09/14

Below are the rise and set times for STS-64 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note
that all times are in UTC.

Rise= time (HH:MM:SS) the Shuttle Orbiter appears at the horizon
Az= Azimuth (true) where the Orbiter will rise.
Maximum= time, azimuth (Az), and elevation (El) of the highest part of the pass
Set= time and azimuth when the Shuttle descends below the horizon
Orb= the number of this orbit
Rise MET= The Mission Elapsed Time at the rise. Format is DD:HH:MM:SS

SB SAREX @ AMSAT $STS-64.014
SAREX Orbital Elements 9/13 at 12:45 UTC

Greenbelt, MD September 13, 1994 at 12:45 UTC

Gil Carman, WA5NOM reports that Element Set GSFC-14, provided by Ron Parise,
WA4SIR, is within 1 second of a current (orbit 59) orbiter state vector.
This element set will be the official SAREX set for today.

I heard Susan, KB5IWS, from STS-64 on 145.55 last night making two differnet
QSOs.

She did not call CQ, and From what I understand, "YOU" have to call CQ,
and they (Susan) will answer you.

I'm curious about plotting when and where the shuttle is going to
be. I just FTP'ed SatTrack and was unable to compile it on my
machine. I went to the ports at freebsd.cdrom.com and theirs wouldn't
compile correctly either. Has anyone who is reading this compiled
SatTrack under FreeBSD 1.1R? For that matter ANY satellite tracking
program that will work under FreeBSD 1.1R is welcome. Any
recommendations are appreciated.

ASA MEMBERSHIP INFORMATION

The Electronic Journal of the Astronomical Society of the Atlantic (EJASA) is published monthly by the Astronomical Society of the Atlantic, Incorporated. The ASA is a non-profit organization dedicated to the advancement of amateur and professional astronomy and space exploration, as well as the social and educational needs of its members.

ASA membership application is open to all with an interest in astronomy and space exploration. Members receive the Journal of the ASA (the JASA is a hardcopy sent through United States Mail and is not a duplicate of this Electronic Journal) and the Astronomical League's REFLECTOR magazine. Members may also purchase discount subscriptions to ASTRONOMY and SKY & TELESCOPE magazines.

For information on membership, you may contact the Society at any of the following addresses:

Astronomical Society of the Atlantic (ASA)
P. O. Box 15038

Atlanta, Georgia 30333-9998
U.S.A.

ASA BBS: (404) 321-5904, 300/1200/2400 Baud

or telephone the Society Recording at (404) 636-3642 to leave
your address and/or receive the latest Society news.

ASA Officers and Council -

A HISTORY OF METEOROLOGY AT THE PIC DU MIDI OBSERVATORY

Emmanuel Davoust
Observatoire Midi-Pyrenees,
14 Avenue Edouard Belin, 31400 Toulouse, France
davoust@obs-mip.fr

and

Jacques Damiens
Meteo France,
1 Quai Branly, 75007 Paris, France

Summary

Meteorology was the main activity of Pic du Midi Observatory until astronomy prevailed around 1937. Three directors, Vaussenat (1882-1892), Marchand (1892-1914), and Dauzere (1920-1937), ensured smooth running of this Observatory, which was often caught in storms and lightning at an altitude of 2,880 meters. They gathered and successfully analyzed the numerous meteorological data obtained by the two observers at the summit.

Introduction

Pic du Midi Observatory, located near Lourdes in the center of the Pyrenees Mountain Ridge in southern France, owes its international renown to the remarkable astronomical observations that were carried out there. However, its vocation for astronomy is recent. The Observatory's long ties to meteorology are worth recounting. In fact, from its founding in 1882 to the naming of an astronomer as director in 1937, meteorology was the principal, and for a long time the only, activity at this Observatory.

The Observatory at Sencours Pass

The project of establishing a meteorological observatory at the summit of the Pic du Midi dates from 1872. The project was launched by the Societe Ramond, a group of men interested in the Pyrenees Mountains. Charles Champion du Bois de Nansouty, a retired general, was named as the head of the project, and Celestin-Xavier Vaussenat, a civil engineer, was charged with presenting the project to the public and collecting money, since the financing of the construction and the running of this private Observatory was to come from private donations.

A temporary meteorological station was established at the Sencours Pass, at an altitude of 2,366 meters, just below the summit of Pic du Midi, in 1873. The observers were lodged at the inn that had been built a few years earlier. The instruments were placed on the Plantade knoll, named for an astronomer who had died there in 1741.

Measuring instruments were also placed at the summit of the Pic du Midi.

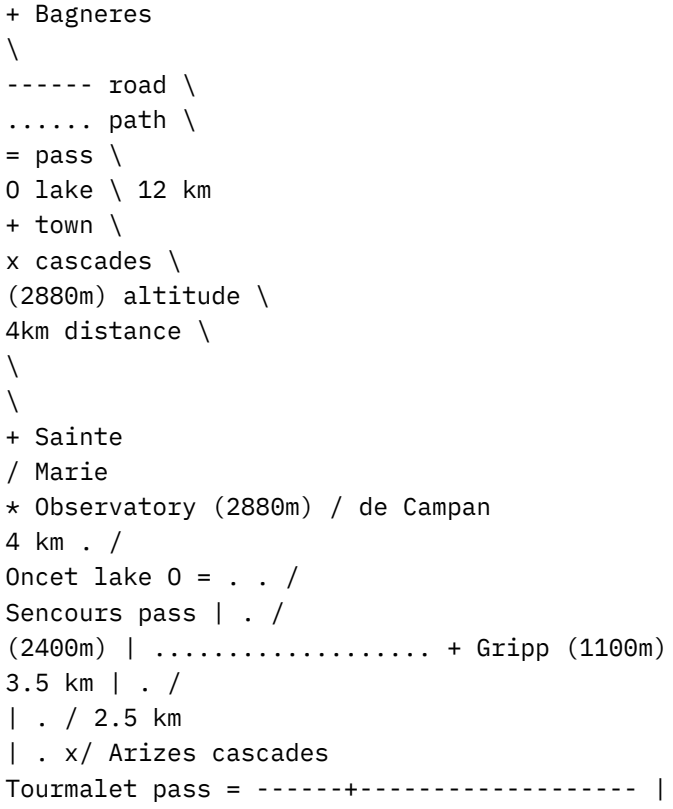
General de Nansouty, observer Baylac, and a cook spent six winters at the pass. Every day they took four series of six to ten meteorological readings at the Plantade knoll, at 7 and 10 a.m. and 4 and 7 p.m.. Once each day, observer Baylac would climb to the summit of the Pic to take a reading at 12:43 p.m. (7 a.m. in Washington, D.C.). The results were transmitted to General Albert Myers, Chief of the United States Signal and Meteorological Service, following the recommendations of the Congress of Vienna.

In 1880, observers could stay in the permanent buildings at the summit of the Pic du Midi. The Observatory was officially inaugurated in 1882 and donated to the State on that date, on condition that the State would take over the 45,000 Franc debt, and that it would give 30,000 Francs a year for the observers' salaries and to maintain the building. Vaussenat was named director.

The Organization of the Observatory

The Pic du Midi Observatory's exceptional location at an altitude of 2,880 meters was not without constraints. The whole story has to be known in order to understand its history until 1952, the date at which the Observatory was linked to the rest of the world by two cable cars, drastically changing life at the summit.

Map of the Access to Pic du Midi Observatory



(2115m) 4km La Mongie (1800m) \ _|
x

At the summit, the personnel was composed of two assistant meteorologists and two general helpers. The first observers were Leandre Ginet and Sylvain Latreille. They carried out both meteorological and astronomical observations. After a preliminary reduction, they transmitted them to Bagneres de Bigorre, where the Director exploited them. In the 1930s, the two assistant meteorologists, Hubert Garrigue and Joseph Devaux, were more than just observers: Both were preparing a thesis on atmospheric electricity and on glacier snow, respectively.

There were more people at the Observatory during the brief summer period, when access was easier. The director, visiting astronomers, naturalists, and physicists stayed there while doing their research. It was at this time of year that the annual inspection (until 1920) by two scientists named by the Central Meteorological Office in Paris took place.

The director ran the Observatory from Bagneres (altitude 550 meters), a small spa in the valley about 27 kilometers away from the Observatory. He was linked to the summit by a telegraph line that was often cut by bad weather conditions. The director was responsible for administration, management, and scientific observations (meteorological, seismological, magnetic, and astronomical). His hardest job was certainly ensuring the smooth running of life at the top, managing supplies (especially when the weather blocked access), human problems, and the correct functioning of the instruments, most of the time from a distance.

A position of assistant meteorologist was created in Bagneres in 1900, which Jean Dort held until 1934. Joseph Bouget, the Observatory botanist, never had a permanent position. He took care of botanical gardens at the summit, in Bagneres, and at several intermediate altitudes. Bouget often observed when one of the incumbents was sick or on vacation. In Bagneres, occasional employees paid by the hour worked as secretaries, accountants, or librarians.

There was an important intermediate stage between Bagneres and the Pic: The Brau Inn at Gripp and the Observatory's depot, 2.5 kilometers after Gripp. Jean Brau, and later his sons, played an essential role in the Observatory's daily life. It was they who organized the conveying of men and food to the summit, in winter as well as in summer. The road suitable for vehicles joining the Tourmalet Pass to the Laquets (altitude 2,600 meters) was built only in 1934 and can only be used in the summer (this is still the case!). Before that date, the only path to the summit was a mule trail. In the winter until 1952 this trail had to be followed to the top, sometimes at the risk of being carried away by an avalanche. Three porters died in this way in November of 1882.

Five to eight hours were needed to climb on foot or skis from Gripp to the summit, depending on weather conditions. Ascents usually took place once each week, but often bad weather prevented them. In the history of the Pic, it very often happened that men would be blocked at the summit without getting supplies for one month or more. Most of the supplies - canned food, wine, fuel - were carried by mules between July and September. The rest of the time, porters carried the supplies on their backs. Since this was very expensive, portages were limited to fresh food and indispensable equipment.

Life at the Summit

Life at the summit was very difficult during the winter, which lasted eight to ten months. Snow fell in October at the latest, and melted only at the beginning of July. At the end of the winter there were often several meters of snow on the terraces (this is still the case!). The buildings were badly heated, poorly insulated against bad weather, and let dampness and even snow come into the structures. The roofs had to be cleared when the weight of the snow threatened to make them collapse, and tunnels had to be dug in the snow to let the light in when the windows were buried.

In an 1886 letter to Eleuthere Mascart, director of the Central Meteorology Office, Marcel Brillouin, a renowned French physicist, describes one of the observers: "Ginet got there such terrible rheumatic pains that he could not put his feet down without suffering. (...) A crack in the vaulted ceiling loaded with snow let water drip into his room until the summer, as long as the snow could not be cleared; and to make sure that everybody else followed the rules, he nevertheless stayed in that room, whose dampness you can imagine."

After the cold and the snow, the main problem facing the men at the Pic was lightning. It is in fact still a problem today. A network of lightning rods, linked by a cable 1,200 meters long to Lake Oncet (below Sencours Pass), ensured a minimum of security and channeled away most of the lightning. This network also eliminated accidents, previously quite frequent, caused by lightning in the upper parts of the valleys leading to the Pic. It sometimes happened, however, that the lightning came up to the summit along the telegraph wire, despite the lightning rods installed all along it.

Storms were (and still are) spectacular at the Pic, as witnessed in a letter from Vaussenat to Mascart, dated July 12, 1887: "Last night, from 9 p.m. to midnight, we were able to observe the most grandiose storm that we have ever seen, and which hit the central Pyrenees and came within a kilometer of our peak. The Pic was unharmed, thanks to our set of lightning rods and their good conductors. But never had we seen the St. Elmo's Fire with such intensity; there seemed to be real fixed, luminous, blue and red centers. The envelopes themselves were luminous. It was fairy-like, it hailed abundantly."

Vaussenat's Direction (1882-1892)

Vaussenat was mainly concerned with improving the installations at the summit, enlarging the terraces, building new shelters or permanent buildings. He was interested in everything that happened at the peak, and carefully noted all the phenomena which attracted his attention: Frost on the windows, on the metal of the doors, St. Elmo's Fires, lightning bolts, and rings around the Moon or the Sun. Vaussenat wrote about them in his letters to Mascart.

Daily meteorological observations were the summit's principal activity, but they did not seem to be well done, according to Marcel Brillouin who inspected the Pic in 1886. "The actinometric observations never made any sense. (...) The anemometer and the weather vane do not show anything in the winter, and mean nothing in the summer. The barometer was empty, and even though observed carefully, the thermo-meters too. As for the hygrometer and the pluviometer, I believe they need special precautions to work correctly."

An important function of the Observatory was to forecast bad weather and to warn the population, a service appreciated by the administration and by farmers. Indeed, the Pic du Midi's privileged location, an isolated peak in the Pyrenees chain, allowed observers to forecast atmospheric disturbances, storms, and also floods of the Garonne, Adour, and Gave de Pau Rivers. Unfortunately, the lack of communications did not always let these warnings be given rapidly.

An important experiment in atmospheric physics was attempted between 1884 and 1887: The Lemstrom experiment, named for the Swedish scientist who tried to produce artificial Aurorae Borealis in 1882. This experiment was suggested by the Central Meteorology Office in 1883 and carried out at the Pic du Midi by Vaussenat. The Pic's summit was covered with a network of 400 square meters of wire ("the Lemstrom network"), in order to tap atmospheric electricity. Unfortunately, the network mostly attracted lightning, with disastrous results for the equipment and danger for the personnel. The experiment had to be given up before giving any scientific results.

Marchand's Direction (1892-1914)

Emile Marchand, the Observatory's second director, established a meteorological station at Bagneres. He also perfected a simple code so that the observers at the summit could give a rapid (less than one quarter of one hour), succinct, but precise description of the cloud cover (with the speed and the altitude of the clouds) several times each day. In this way, he obtained simultaneous readings at two altitudes (550 and 2,880 meters) that were completed by readings at intermediary altitudes taken during ascents of the Pic. He also continued the seismological and magnetic measurements started by his predecessor.

These initiatives let him gather very numerous and complete data which Marchand spent years analyzing. He was thus able to acquire great knowledge of the atmospheric and meteorological phenomena in the neighborhood of the Pyrenees chain. He would make weather forecasts

for the next 24 hours, which were reasonably correct ninety percent of the time.

Among Marchand's works we should mention: A lifelong study of the correlations between solar activity, earthquakes, geomagnetism, and atmospheric physics, a method for establishing a local weather forecast (1911), the effect of the Pyrenees chain on the rainfall and the asymmetry of the region's valleys (1903), and a long study of the temperature and the tension in water vapor (1894-1898). He presented all his works in talks at many colloquia. Unfortunately, most of his works were published in the proceedings of the various colloquia and in obscure publications, like the Bulletin of la Societe Ramond, where they are still waiting to be read.

One of the observers, Sylvain Latreille, was also supposed to make astronomical observations, to take daily readings of sunspots, Moon observations (to search for a lunar atmosphere), Jupiter and Saturn's satellites (ephemerides), and to map the zodiacal light.

It was under Marchand's direction, in 1906 and 1907, that a real astronomical station was installed at the summit of the Pic du Midi by Benjamin Baillaud, who was then director of Toulouse Observatory. A fifty-centimeter equatorial reflector telescope was brought up to the summit in the course of two summers, thanks to the efforts of a group of soldiers of a regiment in Tarbes. It was reserved, though, for astronomers from Toulouse and for visiting astronomers who had to ask permission from Toulouse Observatory's director. This reflector, which was very inconvenient to use, was hardly used until 1942, when it was completely transformed.

Marchand died in April of 1914 and was only replaced at the end of the First World War (1918) by Joseph Rey, a former naval officer who resigned in 1920.

Dauzere's Direction (1920-1937)

The Observatory suffered from the lack of maintenance during the war. Camille Dauzere not only repaired the buildings and the terraces, but also improved living conditions at the summit, built other buildings, and attracted scientists of all kinds.

In 1926, the Observatory became an "Observatory and Institute of Terrestrial Physics", like those in Paris, Clermont-Ferrand, and Algiers.

Dauzere was a physicist. He took up Marchand's meteorological works and, being particularly interested in lightning and hail, tried to link these phenomena to the air's electrical conductivity. He worked more closely with Bouget, who for the past thirty years had been making a detailed study of all the lightning bolts that he knew about in the region. They were thus able to establish some simple rules:

"Lightning preferably strikes certain privileged places, that are not necessarily protuberant points of the ground. The location of those places that are often struck by lightning is related to the nature of the rocks that make up the ground. The areas most exposed to lightning are often located on contact lines between two different geological terrains. (...) Places where hail originates (...) are linked with places where lightning strikes."

The Pic du Midi's astronomical renown began in the 1930s, with Bernard Lyot's work on the solar corona outside periods of eclipse. In 1937, the naming of Jules Baillaud (Benjamin Baillaud's son) as director of the Observatory confirmed this conversion to astronomy.

Conclusion

This brief survey of the history of the Pic du Midi Observatory shows that it was always a high point of interdisciplinary studies. Thanks to the will of several men and to the courage and perseverance of many others, this Observatory allowed scientific progress in very different fields: Meteorology, botany, astronomy, atmospheric physics, particle physics, cosmic rays, physiology, etc. It would be extremely regrettable that the present economic difficulties should lead to its abandon, because its history holds much promise for its future.

Acknowledgments

We would like to thank Mr. J. P. Legrand who told us about the existence of documents on the Pic du Midi Observatory at the archives of Meteo France. This paper has been published in French in "La Meteorologie".

About the Authors -

Emmanuel Davoust (davoust@srvdec.obs-mip.fr) is an astronomer at Midi-Pyrenees Observatory. He does research on the morphology and dynamics of galaxies, mainly based on observations obtained at Pic du Midi Observatory. Emmanuel is also working on the history of French astronomy and that of Pic du Midi Observatory in particular. He has

published a book on the search for life in the Universe titled THE COSMIC WATER HOLE (MIT Press, 1991).

Jacques Damiens is an archival officer at the main library of the French Meteorological Office. He is interested in the history of meteorology and has published several papers in that field.

MIRROR MAKING CLASS OF 1993: A REVIEW

by Paul Dickson

From the February, 1994 issue of the Saguaro Astronomy Club's newsletter, SACNews, in Phoenix, Arizona

Last summer, fifty people gathered together at Scottsdale Community College in Arizona to grind mirrors for telescopes. Although it was called a class, no grades were given, as the goal was to learn how to build telescopes from the mirror blank up. The class typically met twice each week, with exceptions when the school was closed for holidays or when the East Valley Astronomy Club (EVAC) had their monthly meeting. The class was taught/led by Leon Knott with assistance from his wife Fannie.

In the Beginning

The class held its first meeting on April 29, 1993. This first meeting covered basic mirror math, enough so that class members could choose the f-ratio of their mirror as well as ordering the mirror blanks in the sizes we wanted. Mirror sizes built by the class ranged from four inches up to twenty inches.

The first working meeting was in June, after the mirrors blanks had arrived. In this meeting we beveled the mirror edges to prevent chipping while we did the rough grinding. Those who were still unsure of their f-ratio were given another overview of how to compute the grinding depth needed in the glass.

The class met informally. It was not required that everyone attend all meetings. In fact, with the large size of the class, a few missing people gave everyone else a little more elbow room. For the most part, all of the tools for our mirrors were poured from dental plaster during the first couple of nights. "As much plaster as a dental lab uses in six months", according to Leon.

The meeting after pouring the tools, ceramic tiles were epoxied to the tool. The epoxy was the single most expensive item after purchasing the glass. But it was well worth it: If the tiles were not held in place, then a lot of work could be lost, as one person found out who did not use epoxy.

The Grind

Generating the curve of the mirrors was done with 80 grit particles. This was used to get within a few thousandths of one

inch of our desired depth. Those who had mirrors sixteen inches and larger had their mirrors pre-generated to almost the correct curve, allowing them to skip this first step, which could consume a lot of time for them.

After reaching nearly the correct depth, we switched to 120 grit. After this point, we switched to the next smaller grit size when the surface had a uniform smoothness under a 30X magnifier. The next sizes in sequence were 220 grit, 40 micron, 25, 12, 5, and then 3 micron.

At this point polishing pads were then used with 1 micron serum to accelerate the polishing before moving to the pitch lap. We were told by Leon that he had experimented with the polishing pads in previous classes and their use significantly cut down the number of hours on the pitch lap, but did not replace the pitch lap.

The pitch laps were poured on the ceramic tools when Leon did not already have a tool of the correct size. They were covered in pitch with channels cut to form small squares of pitch maybe 0.75-inch on one side, separated by narrow channels.

The Test

By the time we were well into using the polishing pads, we could now see a reflection off the surface of the glass. It was time to use the Ronchi tester to determine the rough shape of the glass surface. The goal in polishing the mirror was to get the surface as smooth as possible and get the surface spherical. The polishing pads left the surface with a roughness as well causing some zonal errors. These needed to be removed before figuring could take place.

In the Ronchi tester, when the mirror was spherical, the lines in the tester would appear as straight vertical lines. If the lines converged in the center, the center was too high relative to the rest of the mirror's surface. If the lines diverged, then the center was too deep. After making the mirror spherical, figuring would parabolize the shape and the resulting mirror would have lines that diverged to some degree. First, though, we all had to get our mirrors spherical.

The Ronchi tester also showed the roughness of the mirror. On a smooth spherical mirror the vertical lines of the Ronchi tester would appear clear and sharp. The roughness would appear as a haziness at the edge of the vertical lines.

After the mirror was spherical and as smooth as your patience allowed came the figuring. This was done with star laps. The star laps where the same pitch laps but had a four (or more) pointed star cut in the pitch. The center of the star was the center of the pitch lap. The full size lap was still used but a smaller star lap was also used for finer work.

The Strokes

Leon had the class do two different strokes with the pitch laps. The most common was to take the smaller lap and do an edge-to-edge stroke, centering over the part of the mirror where the most work was to be done. This center started at the center of the mirror and moved outward. Since both the mirror and tool were rotated this made the work uniform around the circumference of the mirror. The problems with this is that the smaller tool could do too much if not monitored frequently and could easily add roughness.

The other stoke Leon had the class use was the W-stroke. This stroke moved the tool over most of surface in a W or M fashion. If you got lazy, it could be called a Z-stoke. This used the full size lap and worked quite a bit slower. The points of the stoke were at the points you wanted to do the most work. If you wanted to work out the center then the center of the tool was moved to the edge of the mirror. If you wanted to work the ring midway from the center to the edge, then the tool would only uncover that part of the mirror that was outside the ring.

During the class, Leon would perform the Focault test at home between sessions. This would allow the mirrors time to equalize with the temperature of the testing environment.

The class lasted four months and several people finished their mirrors before the class ended. Most finished theirs shortly after, while a few are still working as you read this. By the end of May 1994, even the twenty-inch mirror was getting its final figuring (the physical plant is huge). Case in point is the author, who has had first light but still has not finished the mounts.

An Example

When I started in the mirror making class, I didn't really want to make a large telescope and I already had an eight-inch instrument. So I decided to make a five-inch one so I could have a telescope that was really portable. Around this same time, an article appeared in SKY & TELESCOPE magazine about a small solar telescope. This left me undecided on which direction to go, but with the cheapness of the five-inch mirror blanks, I decided to grind two mirrors.

I decided to grind one blank first and later, after completing the first mirror, I would start the second. This would allow me to learn from any mistakes I might make rather than duplicating them as I progressed.

It took nearly one week to get started with the rough grinding. First was pouring the dental plaster tool and letting it dry. The tools was hard within a few minutes, but it took time for it to dry completely. After it had dried, we had to epoxy ceramic "bathroom" tiles on to the tool surface. These were allowed to dry pressed against the mirror protected by wax paper. At the beginning of the second week of class, the grit started flying.

On my first mirror, I planned on a f/5.5 which meant I had to grind out 0.057-inch of glass from the center of my mirror. It may not look like much, but it took me seven class sessions to get to depth and start using the Ronchi tester. I also took home sore arms and wrists during the first weeks of rough grinding.

Problems

It only took two more sessions of polishing to completely polish the surface. The surface was really smooth. The trouble was I had a zone on the surface that I could not seem to get rid of. I attempted to polish it out but all attempts only pushed the zone closer or further from the edge.

At this time, everyone else was testing their mirror, too. So the testing cycle with the Ronchi grating was a few minutes of polishing followed by tens of minutes waiting for the tester. At this time, the last few sessions of class, I decided to start my second mirror. I could work on mine with the few others who were still working at 80 grit, far away from those polishing and figuring. I reserved my working on the first mirror to when I was over at Leon's.

After playing with the zone on the mirrors surface for over thirty hours of work, I spent twelve hours at Leon's with his turntable and finally removed the zone. From a nearly spherical mirror, it took less than five hours of work. The resulting mirror was f/5.4 with a surface wavefront error of 1/14-wave done in a total of 72 hours of work.

The Second Mirror

The second mirror was entirely different in both design and implementation. It was supposed to be a five-inch f/8 solar telescope. The reflecting surfaces would be uncoated. Making this mirror had all sorts of surprises. First I used the f/5.4 tool from my first mirror. This caused my second mirror to grind down to 0.057-inch when I really only wanted 0.039-inch. I had ground, in two class sessions, a second f/5.4 mirror. I then had to continue grinding another session to get back to 0.039-inch, adding glass to the middle by actually removing it from the edge.

From beginning to end, my second mirror took just less than 25 hours of work. It is a five-inch f/7.75 with a surface wavefront error of 1/54-wave. Leon's Focault tester is only good to 1/16-wave in resolution, though.

Now I just have to build the physical plants for the telescopes. I looked into a coelestat for the solar telescope so I can mount video equipment on a unmoving telescope, but I decided on an English Yoke instead.

Throughout the class Leon and Fannie remarked on how well the class went. The only problems encountered by class members were minor and easily fixed. No one had serious problems with their mirror surface. My own problems were fairly minor and resulted in doing and

undoing work until I understood which direction I needed to take. The class had one mirror break while being ground (a six-inch) and one person - who did not use the epoxy - lost his tiles while grinding.

The polishing pads did introduce zonal problems on to a large number of class member's mirrors. This did not happen in previous classes that Leon has taught and he is not sure why it did occur. The use of polishing pads will require more experimentation.

The Next Telescope

While waiting for parts and money for completing these two telescopes, I am researching designs for my next telescope: A ten-inch Gregorian convertible Newtonian. It even sounds impressive.

YOU CALL IT WHAT?

by M. Leon Knott

From the March, 1993 issue of the Saguaro Astronomy Club's newsletter, SACNews, in Phoenix, Arizona

Well, here we are, class. Summer, with its hazy skies and too hot temperatures has given way to blessed fall, with cooler temperatures and incredible skies. Now is the time to take out those new binoculars, telescope, star charts, or books you just could not resist, as you begin mining the riches of the night time sky.

Right away, with the general cussedness and perverseness of life, you face a seemingly impossible task. All those stars have such unusual names and just how do you really pronounce something like Betelgeuse and some others even worse? After all, one does not wish to appear unknowing about such elementary things when in the company of friends, spouses, students, ministers, and school teachers, right?

I recently experienced such a problem when visited by the late well-known Walter Scott Houston, author of SKY & TELESCOPE magazine's "Deep Sky Wonders" column for nearly 47 years. Sitting in our living room, we were talking about galaxies, clusters, and nebulae when I happened to mention the beautiful double star in Orion we know as Rigel (rhymes with a well-known antacid). Mr. Houston looked at me and said, "It's Rigel (rhymes with regal)." To which I replied, "Rigel (rhymes with that well-known antacid)."

At that point the famous Walter Scott Houston glared at me and said, "How many advanced degrees do you have?" When I answered that I had one degree and that it did not amount to very much, he said "Well, I have three degrees and two fellowships. It's Rigel (rhymes with regal)."

Glancing up, I could see my wife Fannie and two daughters, Dottie and Kana, smirking at me, and believe me I know how to pronounce "smirking." Well, Mr. Houston has gone back home, and in the spirit of modest correctness, I hereby affirm that the proper pronunciation of Rigel is Rigel (rhymes with that well-known antacid).

So, in an attempt to share with you my grammatical, syntactical, and pronounciational expertise, and in order to help you become better acquainted with the names of several famous stars, I have drawn up the following short list. If you learn to pronounce the names of these stars properly, you can hold your head high in any crowd and put to

shame anyone who might presume to correct you, whether PhD, school teacher, or even high school kid. If someone does try to push too hard, just tell them you read it here and that ought to be good enough to silence even the most adamant and obdurate.

Let us begin with the bright stars in Orion, since that brilliant constellation commands the fast approaching winter skies. This starry warrior has beacons marking out his shoulders, his belt, and of course, his left foot (Rigel - you already know how to say that), along with his right knee. The bright star that does signify Orion's right knee is Saiph. You will be perfectly safe in pronouncing it "safe" with just a tiny bit of emphasis right in the middle of the word; you know, as if you suddenly realized that an insect had entered your mouth and was conducting extensive and probing explorations in there.

Orion's right shoulder is Bellatrix, and you might say Bellatrix is for kids. On the other hand, his left shoulder is Betelgeuse, and I defy anyone to pronounce it "Beetle Juice" within my hearing. I just simply will not stand for it. You had be much safer in pronouncing it as if it were spelled "Bet Old Joy." Now, doesn't it feel really good when you get it right?

The three stars making up Orion's belt are very famous and are known as Mintaka, Alnitak, and Alnilam. I dare you to say all three name, quickly as you can, three times in a row! These stars point to the eastern direction and help us locate the brightest star in the heavens. This star is seriously bright and is named Sirius. You might even call it Seriously Sirius, if you know what I mean.

Letting the belt lead us in the opposite direction will point us to the glaring red eye of Taurus (like the well-known automobile) the Bull. This bright red star is named Aldebaran. Here, you might say "The Bull attacks us....Al, Deb, and I run (Aldebaran) while Ann tarries behind (Antares, the name of the Scorpion's heart, seen during the summer. I threw it in for free)." Poor Ann.

Well, you have been marvelous students and this is enough for a first session. Later we will cover such important names as Arcturus, Zubeneshamali, Algenubi, Mirach, and perhaps, even Uranus. Being an amateur is fun and informative. It can also give rise to some justifiable pride and perhaps even some gentle snob appeal, especially when we can pronounce all those tough words correctly, with confidence and verve arising out of knowing we are right and all those other guys are wrong.

UP ALL NIGHT: OBSERVING THE PERSEID METEOR SHOWER OF 1994

by Michael Hann

Courtesy of the Astronomy Club of Tulsa, Oklahoma newsletter

A good Perseid meteor shower was observed by three hardy Astronomy Club of Tulsa members who maintained their watches from dusk to dawn at the RMCC observatory at Mounds, Oklahoma (35 degrees 45 minutes North Latitude, 96 degrees West Longitude) on August 11-12, 1994.

The sky was cloudless, though a thin haze reduced the limiting magnitude to 5.5. A generous portion of bright meteors were seen as the shower's peak approached, including one brilliant, bluish -7 magnitude Perseid which left a thirty-second train. A -5 magnitude bluish Perseid appeared to be sparking as it traversed the sky, flared at the end of its path, and then exploded. I observed a Zenithal Hourly Rate (ZHR) of 98 during the interval of 3:30-4:30 a.m., the peak of the shower as observed at Mounds (see the following comments about preliminary reports from California).

Note that the ZHR is a rate corrected for limiting magnitude and shower radiant angular altitude and is not the same as the total number of meteors one observes in one hour. Twenty-six percent of the Perseids I observed were accompanied by trains - persistent, glowing trails.

The Perseids were supplemented by meteors from other radiants, including Kappa Cygnids, Capricornids, and Pegasids. One "meteor" slowly streaked across the sky for a full ten seconds, moving from the southeast to northwest. I assume this to have been some artificial space debris falling back into Earth's atmosphere.

The following histogram represents the number of Perseids I observed in each of the hourly intervals. Data for meteors from other radiants is not included. I did not observe in earnest until 11:30 p.m. (4:30 UT), as the shower was not very active earlier. Central Daylight Time (CDT) is five hours behind Universal Time (UT), the reference time used in all the following data.

```
Hour Interval
----------------
2:30 - 3:29 UT | 1
3:30 - 4:29 UT | 1
4:30 - 5:29 UT | 12345678901
5:30 - 6:29 UT | 1234567890123456
6:30 - 7:29 UT | 123456789012345678
7:30 - 8:29 UT | 1234567890123456789
8:30 - 9:29 UT | 123456789012345678901234567890123456789
9:30 - 10:29 UT | 12345678901234567890123456789012345
------------------------------------------>
Number of Meteors Observed
--------------------------
```

The ZHRs for each of the hourly intervals beginning with the interval 4:30 - 5:29 UT are given next. I calculated the ZHRs following the method presented by Neil Bone in his book METEORS.

```
ZHR = count*(1/sin(angular altitude))*(r^(6.5 - LM)) +- Error
Error = +-ZHR/SQRT(hourly count)
```

Where r is the population index factor. I calculated three sets of ZHRs based on r = 2.2 (per the Royal Astronomical Society of Canada's Observer's Handbook 1994), r = 2.35 (per Neil Bone), and r = 2.6 (per the International Meteor Organization, IMO).

```
ZHRs
Hourly Interval r = 2.2 r = 2.35 r = 2.6
--------------- ------- -------- -------
4:30 - 5:29 UT 46 +- 14 49 +- 15 54 +- 17
5:30 - 6:29 UT 55 +- 14 59 +- 15 65 +- 17
6:30 - 7:29 UT 54 +- 13 58 +- 14 64 +- 15
7:30 - 8:29 UT 51 +- 12 54 +- 12 60 +- 13
8:30 - 9:29 UT 92 +- 15 98 +- 16 108 +- 18
9:30 - 10:29 UT 86 +- 15 92 +- 16 102 +- 18
```

These rates compare well with peak rates of other Perseid showers.

The following histogram represents the magnitude distribution observed during the shower.

```
Magnitude Range
---------------
(+5.5) - (+4.6) mag | 1234
(+4.5) - (+3.6) mag | 12345678901234567890123456
(+3.5) - (+2.6) mag | 123456789012345678901234567890123456
(+2.5) - (+1.6) mag | 1234567890123456789012345678
(+1.5) - (+0.6) mag | 12345678901234567890123456
(+0.5) - (-0.4) mag | 1234567
(-0.5) - (-1.4) mag | 123456
(-1.5) - (-2.4) mag | 1234
(-2.5) - (-3.4) mag | 12
(-3.5) - (-4.4) mag | 1
(-4.5) - (-5.4) mag | 123
(-5.5) - (-6.4) mag |
(-6.5) - (-7.4) mag | 1
----------------------------------------->
Number of Meteors in Magnitude Range
------------------------------------
```

The average meteor brightness in each of the hourly intervals beginning with the interval 4:30 - 5:29 UT are given next.

```
Hourly Interval
---------------
4:30 - 5:29 UT : 3.8 magnitude on average
5:30 - 6:29 UT : 3.1 magnitude on average
6:30 - 7:29 UT : 3.1 magnitude on average
7:30 - 8:29 UT : 1.9 magnitude on average
8:30 - 9:29 UT : 1.2 magnitude on average
9:30 - 10:29 UT : 1.3 magnitude on average
```

It is acknowledged that the Perseid shower now has two peaks: A traditional peak and an earlier peak which is associated with a higher portion of bright meteors as well as higher ZHRs. The peak I observed was the new peak, as evidenced by the increased average brightness during the peak hour interval.

Joe Dellinger, one of the hardy three who stayed up all night at the observatory, and who has recently moved to Tulsa from Hawaii, sent me E-Mail reporting that ZHRs reached a peak of 250 as observed at Honey Lake, California, after dawn had broken in Mounds.

About the Author -

Michael Hann developed an interest in amateur astronomy as a child growing up in rural Illinois. This interest lay dormant for a long time until reawakened several years ago while laying in the autumn leaves of his backyard, looking up at the sky with his two year-old son. Michael is now a member of the Astronomy Club of Tulsa and enjoys leading observation sessions for public groups at the club's RMCC observatory - which houses a sixteen-inch Newtonian reflector telescope - observing with his 10x70 binoculars, and watching meteor showers.

Michael works as a software engineer. He intends to design and construct a forward scatter radio meteor detection system during the next year and welcomes any advice you might wish to give him on this topic. Please send E-Mail to mikeh@ssd.fsi.com.

ANNOUNCING A NEW PUBLICATION: SETIQUEST MAGAZINE

by Carl Helmers

SETIQuest is a new quarterly print/electronic mail (E-mail) periodical containing news, technical information, and tutorials devoted to bioastronomy and its subset, SETI (Search for Extraterrestrial Intelligence).

SETIQuest is published for professionals, serious amateur astronomers, and individuals curious about this fascinating field of observation. SETIQuest fills the need for a specialized astronomical publication devoted exclusively to the on-going search for evidence of life in the Universe. Such evidence could be intentional or inadvertent signals of other civilizations. Such evidence could be found in spectral signatures of biological activity on extrasolar planets or in the interstellar medium.

SETIQuest is written and edited for the scientifically literate individual taking part in the progress of our technological civilization, with articles by amateur and professional scientists. SETIQuest includes information about hands-on observational programs that can be carried out by individuals and groups of amateur astronomers at radio and optical wavelengths.

SETIQuest is filled with articles covering topics such as:

* Tutorials about bioastronomy and SETI
* Microwave or optical SETI as practiced by amateurs
* "Do-it-yourself" participation in bioastronomy and SETI activities
* Book reviews
* Regular commentary on issues relevant to SETI and bioastronomy:

SETI and the political milieu

Philosophical issues regarding the prospects of success and failure in the search

SETI as a parable of science versus pseudo science

Publications Watch: Summaries of recent scientific/general publications relevant to SETI

For your FREE issue of SETIQuest (Volume 1, Number 1), send us your postal address by fax, E-mail, or conventional mail to:

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

SB SAREX @ AMSAT $STS-64.015
SAREX Update 9/14 at 2:30 UTC

Silver Spring, MD, September 14 1994 at 2:30 UTC

SAREX Contact on Satcom C1 Satellite Downlink

Those who wish to see a SAREX school group contact in action and have
access to a C-band TVRO dish will have a special treat later today.
The Step/STAR Schools Young Astronaut group, located in Spokane, Washington,
will talk to the space shuttle astronauts through a special telebridge link
which is expected to begin at appoximately 18:10 UTC. This contact will be
broadcast live via the Satcom C1 satellite on transponder 18. C1 is also
designated F1 and is located at 137 degrees West Longitude.

School Group Status

8 of the 10 planned school group contacts have now been successfully completed.
The Springfield Plains Elementary, in Clarkston, Michigan had an outstanding
9 minute contact with mission specialist Jerry Linenger, KB5HBR. 26 questions
were asked by the students during this event. Reports from the coordinators
at all the schools have been thankful of the outstanding educational program
that SAREX provides the students. At the Crystal Lake South Elementary school
in Illinois, the students got an "elementary" demonstration of circular
polarization. The technical team at the school demonstrated to the students
that left hand polarization of their antenna provided up to a 4 S unit
improvement in the signal over right hand circular polarization for some
portions of the pass over the Chicago area. Chalk up another one for SAREX
volunteer ingenuity!

General Voice and Packet QSOs

We have gotten several reports from radio amateurs and the shuttle crew that
general voice QSOs are being made. Please remember that the astronauts
are not awake around the clock. Their 8 hour sleep period ends at 11:22 UTC
on 9/14, at 9:52 UTC on 9/15, at 10:22 on 9/16 & 9/17 and at 9:52 UTC on 9/18.
Also, as I reported at the beginning of this flight, Shuttle power
conservation measures, required to support an extra (10th) day of flight, has
resulted in no packet radio operation to date. It is hoped that the packet
system will be turned on later in the flight. The SAREX team will keep you
posted. Please remember to listen on the downlink frequency (145.55 MHz) for
the packet activity BEFORE sending packet connects to the Space Shuttle.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

Hello Doug,

The simplest ant I have used to work the shuttle has been a pair of crossed dipoles. It's is as the name would suggest just two halfwave dipoles laid out horizontally and at right angles to each other, so they form a "X" if you like and phased with a 1/4 wave matching stub. You should be able to buy one quite easily from a good ham shop or if you like I'd be more than happy to mail you with the details of how to build one.

Question for you if I may, where can I get a copy of MacSPOC ?

Kind regards,

Sean.

1427. AO-13 schedule changed or not?

Oscar 13 still seems to be on the "pre-Sept. 12" transponder schedule, with mode S from MA 120-150, and Mode B afterwards.

Signals are very strong, indicating that maybe the attitude hasn't changed.

Has the schedule change and/or attitude change been postponed?

>and they (Susan) will answer you.

Don't call CQ or their callsign, say just *your* callsign using ITU
phonetics and _nothing_ else.

Even if they don't pick out your callsign and answer you it will be recorded
on their tape recorder and may be recognizable when they analyze the tapes
on the ground.

ARLS029 SAREX voice and packet

Shuttle Voice and Packet QSOs

NASA Mission Control reports that the Space Shuttle Discovery continues to perform without any system problems at an altitude of 140 nautical miles. Astronauts Carl Meade and Mark Lee are preparing today for Friday's untethered spacewalk.

Earlier this week, mission managers gave the go ahead to extend the mission an extra day after evaluating electrical power usage thus far. The latest margins showed electrical power consumption is running below pre-flight predictions to provide enough hydrogen and oxygen to permit an extra day of science data. The STS-64 mission now is scheduled to conclude with a landing September 19 in the early afternoon.

This mission has proven to be very successful for the Shuttle Amateur Radio EXperiment payload. Already, 9 of 10 scheduled schools have made successful ham radio contacts with the shuttle crew. The SAREX Working Group has also received dozens of reports from radio amateurs and the crew that general voice QSOs are being made. Please remember that the astronauts are not awake around the clock. Their 8 hour sleep period ends at 1022 UTC on 9/16 and 9/17 and at 0952 UTC on 9/18. Also, as has been reported since the beginning of this flight, shuttle power conservation measures, required to support the extra day of flight, have resulted in no packet radio operation to date. It is still hoped that the packet system will be turned on later in the flight. SAREX is currently functioning in configuration B, which means the handheld SAREX transceiver is being operated by battery. The SAREX team will keep you posted of any changes. Please remember to listen on the downlink frequency, 145.55 MHz, for packet activity before sending packet connects to the space shuttle.

The crew uses separate receive and transmit frequencies. Please do not transmit on the shuttle's downlink frequency. The shuttle's worldwide SAREX downlink frequency is 145.55 MHz. Stations may transmit to the shuttle on FM voice at 144.91, 144.93, 144.95, 144.97 and 144.99 MHz. In Europe, stations use 144.70, 144.75 and 144.80 MHz. The crew call signs are KB5SIW, KC5HBS and KC5HBR. The worldwide packet uplink frequency is 144.49 MHz. The packet call sign is W5RRR-1.

Amateurs should transmit only when the shuttle is within range for a contact and you can hear the shuttle's downlink signal. The following represents the latest Keplerian Elements as generated by Ron Parise, WA4SIR, at the Goddard Space Flight Center and checked by Gil Carman, WA5NOM, at the Johnson Space Center.

STS-64

1441. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-09-15 23:06:32 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.779670392@afit.af.mil>
Source record: 26889

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

SB SAREX @ AMSAT $STS-64.019
STS-64 Western R/S Times 09/17

Below are the rise and set times for STS-64 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note
that all times are in UTC.

Rise= time (HH:MM:SS) the Shuttle Orbiter appears at the horizon
Az= Azimuth (true) where the Orbiter will rise.
Maximum= time, azimuth (Az), and elevation (El) of the highest part of the pass
Set= time and azimuth when the Shuttle descends below the horizon
Orb= the number of this orbit
Rise MET= The Mission Elapsed Time at the rise. Format is DD:HH:MM:SS

SB SAREX @ AMSAT $STS-64.021
SAREX Keps 9/16 at 06:00 UTC

Silver Spring, MD September 16, 1994 at 06:00 UTC

The following represents the latest Keplerian Elements as
generated by Gil Carman, WA5NOM, at the Johnson Space Center.

STS-64
1 23251U 94059A 94259.03185091 .00002390 10715-4 74540-5 0 231
2 23251 57.0071 195.8801 0009155 273.4485 86.5562 16.11758113 994

Satellite: STS-64
Catalog number: 23251
Epoch time: 94259.03185091 = (16 SEP 94 00:45:51.91 UTC)
Element set: 023
Inclination: 57.0071 deg
RA of node: 195.8801 deg Space Shuttle Flight STS-64
Eccentricity: .0009155 Keplerian element set JSC-023
Arg of perigee: 273.4485 deg from NASA flight Day 7 vector
Mean anomaly: 86.5562 deg
Mean motion: 16.11758113 rev/day Gil Carman
Decay rate: 2.390e-05 rev/day^2 NASA Johnson Space Center
Epoch rev: 99
Checksum: 296

Submitted by Frank H. Bauer, KA3HDO, for the SAREX Working Group

Thomas A. Boza~ (tboza@sedona.intel.com) wrote:

: I heard Susan, KB5IWS, from STS-64 on 145.55 last night making two
: differnet QSOs.

: She did not call CQ, and From what I understand, "YOU" have to call CQ,
: and they (Susan) will answer you.

I've heard two of the men on board. I thought they'd always use
the KB5SIW call, but I also heard them use one of the other callsigns
once. Since liftoff, I've had no problems hearing them (a total of
eight times, every evening (German time) except last night when I had
to work late ;-(Twice they even called CQ -- not too surprising
given the fact that the probably don't work too many hams in the Atlantic
ocean. Anyway, once they heard (and phonetically repeated) the last
three letters of my call, but beyond that I've not had any success
working them with my vertical (!).

They've always been on voice -- and NEVER on packet yet that I've heard.
Now I see in the latest ARRL bulletin that they have packet turned off in
order to save power, but might turn it on later in the mission. I hope
so. At least then I won't have to guess which uplink freq. they're using!

73,

MacSPOC v1.5 Users-

The enclosed attitude time line (ATL) was just downloaded from the SAREX Quadra 800 in Mission Control. It reflects Thursday evening CDT planning and is a StuffIt archive packed as BinHex bytes.

MacSPOC Users-

The enclosed checkpoint reflects tracking into Thursday evening CDT, following Discovery's successful rendezvous and retrieval of the SPARTAN satellite. It also includes effects from the HA and CIRC burns lowering Discovery's altitude to 130 nm. No further burns are planned until Monday morning's deorbit to KSC on Orbit 142.

If anyone could post or e-mail the tech. description (frequency(s), duration, etc.) of the "courtesy tones" used by NASA in their Apollo and Shuttle Audio links, I would be sincerely appreciative.

Thanks in advance.

SB SAREX @ AMSAT $STS-64.022
SAREX Update & Keps 9/16 19:30 UTC

Silver Spring, MD September 16, 1994 at 19:30 UTC

No SAREX Packet Operations

The SAREX team at mission control learned today that we will not be
able to turn on the SAREX packet system during the STS-64 mission. The
Shuttle Crew hasworked hard to conserve power to allow the Shuttle to stay
up an additional, tenth day. However, the power budget is such that SAREX
packet could not be energized through the Orbiter power without impacting
primary payload operations. We will, however, continue voice operations
using battery power when the shuttle crew is available. The SAREX team has
had many reports of voice QSOs with the shuttle crew on this flight.

Orbital Elements

The following represents the latest Keplerian Elements as generated by
Ron Parise, WA4SIR, at the Goddard Space Flight Center and checked by
Gil Carman, WA5NOM, at the Johnson Space Center.

1455. BPSK and FM modems

Newsgroup: rec.radio.amateur.space
Date: 1994-09-16 15:51:47 UTC
From: ken@sislnews.csc.ti.com
Message-ID: <940916155147@ken_durham.linear.sc.ti.com>
Source record: 26899

What kind of TNC and Modem should be used for the 9600 baud BPSK and 1200 baud PSK and FM birds? Can a single TNC/modem combo be used for both? There has been some discussion of k9ng and g3ruh modems, but nothing to explain if they are both suitable for Satellite packet.

Would someone tell me what you are using for these modes and what you would recommend for a low budget system?

Ken Durham K5MBV durham@lobby.ti.com

* SAREX SCHOOL CONTACT *
========================
Sal, N9NJF had the pleasure of making a scheduled SAREX contact with Dick, KB5SIW during mission STS-64 on 11-Sep-94 at 23:48 to 23:56 UTC from the Crystal Lake South Elementary School, Crystal Lake, Illinois.

Ed Picha, N9EP reports that the contact went well and solid signals were aquired about 20 seconds after computer-predicted AOS. Six children were chosen to ask questions, and each got to ask 2 questions.

The ground station equipment used to make the contact included a Yaesu FT-736R with Mirage 150 W amp into a KLM-14CX antenna with Landwher preamp mounted on the antenna. A backup configuration consisted of a Motorola SPECTRA, 110 W out to a 5/8 wave vertical antenna at 30 feet.

The antenna was computer controlled with INSTANT TRACK and KC TRACKER. Doppler compensation was accomplished by programming a number of memories in the FT-736 with the appropriate doppler corrected transmit and receive frequencies and switching these memories each minute of the pass. Ed is currently working on some software to perform doppler compensation "automagically" for the FT-736 transceiver, and expects to have it completed shortly.

Ed found that LHCP was superior to RHCP for most of the pass. Some times the difference in received signal strength was as much as 4 S units, even though the antenna in the Shuttle is linearly polarized.

Ed also reports the SAREX contact was a great experience and it was truly rewarding to see the school kids bouncing off the walls when the contact was over. They were REALLY excited!

[Info via Ed Picha, N9EP]

* AMSAT-OSCAR-16 NEWS *
======================
At 0300 UTC on 12-Sep-94, the AO-16 Command Team began to reload the
of the Ramdisk and File Server software on AMSAT-OSCAR-16 after running
without a reload for over 700 days. This "Preventive Maintenance" is
warranted by the accumulation of uncorrectable SEU's (Single Event Upsets)
in the file control structures stored on the ram disk. During the past
year, four uncorrectable SEU's have been recorded in the directory, root
directory and FAT (File Allocation Table) entries of the error logs. In
the past, a crash of the file server software was attributed to these types
of errors. Reloading and running the ram disk software reformats the ram
disk thereby cleaning out all the bad SEU's.

Fortunately these uncorrectable errors have not occurred in the EDAC memory
where the actual spacecraft operational software is run. This allows the
command team to unload and reload a task or tasks with the shortest amount
of file server downtime. The digipeater will be off during this reload and
all stations are requested not to uplink to the satellite during this time.
Thanks in advance for your cooperation.

[Info via Russ Platt, WJ9F, of the AO-16 Command Team]

* LUSAT-OSCAR-19 NEWS *
======================
After a three month period, the file server on the LUSAT-OSCAR-19 satellite
is back in operation. The file server had been out of service since the
spacecraft's on-board computer crashed last May for unknown reasons while
it was over the South Atlantic Anomaly.

An LUSAT command station completed the OBC software reload on Sunday
11-Sep-94 and brought the file server back on line.

[Info via Gustavo, LW2DTZ of AMSAT LU]

* FUJI-OSCAR-20 NEWS *
======================
The FO-20 command team mentioned that digital mode operation of the bird
will be continued for a while because mode switching between digital mode
and analog mode may cause a problem with the onboard command system.

[Info via Kazu Sakamoto, JJ1WTK qga02014@niftyserve.or.jp]

* ITAMSAT-OSCAR-26 NEWS *
========================
After 40 days of idle time, the ITAMSAT spacecraft was switched on by
ground command and a full spacecraft checkout was performed by the control
team. IO-26 was found to be in excellent shape with the battery fully
charged and all critical parameters in a nominal state. Several pieces
of test software were loaded and executed without any problem.

The reason for the delay in bringing IO-26 back on the air was due to the
heavy workload of the control team. Alberto, I2KBD spent some time in
Chile helping the CESAR team, and lightning destroyed the main command
station.

The reload of the IHT code with improved capabilities is scheduled by the end of September to celebrate IO-26's first year in orbit. Until that occurs, expect a few more weeks of idle time.

[Info via Alberto, I2KBD, ITAMSAT Mission Director]

* MIR EVA COVERAGE *
==========
John, G7MIZ, in England reports watching live pictures of the latest extravehicular activity outside the Russian space station Mir on the morning of 13-Sep-94 at 0630 UTC on the COSMOS 2054 satellite, 10,820 MHz, loacted at 15 degrees west longitude. Other noted frequencies were 10,925 MHz, and 11,385 MHz. Peak signal times were 0600 and 1800 UTC.

[Info via John, G7MIZ @ GB7OAR.GBR.EU]

Using InstantTrack V1, it talks about Squint angles for the satellite's antenna pattern. It states that when attitude infomation is added to the element set, that a "squint" angle region will be displayed on the graphical maps for that satellite.

I understand what a "squint" is, its the area where the satellite's antenna is most favorable for communications because of where its pointing at that time.

However now I notice a circle within the main footprint circle for the satellites. Which is the "squint" part of the footprint? How do I know which circle is which?

Message-ID: <$sts-64.024.1994@ampr.org>
Source record: 26819
Cross-posted to: rec.radio.amateur.space,rec.radio.info

SB SAREX @ AMSAT $STS-64.024
SAREX Packet Now Active

Contrary to yesterday's bulletin regarding packet ops, the SAREX team and the STS-64 Astronauts have been given the go ahead to activate the packet system. SAREX packet is expected to be active from now until SAREX stow (unless the crew is using the SAREX gear for general voice QSOs). Those wishing to work the Discovery astronauts in packet mode are encouraged to listen to the downlink frequency, 145.55 MHz, FIRST before transmitting. Ground based radio amateurs need to transmit on the packet uplink frequency 144.49 MHz to have their packet signals heard on the Shuttle. The SAREX packet callsign is W5RRR-1.

Good luck and enjoy!

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

From what I can gather, the Quindar tone is a half second, 450 Hz tone generated by the Quindar transmitter in the Houston MCC. A Quindar receiver at a remote site uses this tone as a cue to key and release the transmitter before and after every voice transmission, respectively.

SAREX Packet QRV

All scheduled SAREX activities have been completed. Lou McFadin,
W5DID, reports that NASA Mission Control has given the STS-64
SAREX crew the go ahead to turn on their packet station. There
will be several passes over the USA between now and stowage time.
This crew likes voice contacts, so don't be surprised if they
show up on that mode.

Equipment stowage commences Sunday, September 18 at 1822z.

Well, packet *finally* got running on STS-64. I'd appreciate copies of beacon texts or other packet copy after 23:55 PDT on 9/17/94 (that's 06:55 GMT on 9/18.94) to see which list I managed to make. Please send 'em to me via email or post 'em.

Congrats to the following hams for their perseverance in getting the following contact numbers (the only ones I copied):

KB7MTC #221
KJ6MD #224
KD6MSM #226

Well, after spending many late nights waiting for the shuttle to pass over.. hearing nothing time after time, it's real nice to know that they "MIGHT" turn it on for the last few orbits... in fact, trying to work the shuttle has gotten as bad as trying to find an open lane at a bowling alley. The only way you can bowl anymore is to become a member of a league. Do the members of the amateur radio community have to go back to elementary school to be allowed to talk to the shuttle anymore? STS-64 was more boring than watching the crystals grow in previous missions.

At least they showed something on NASA SELECT. This time, even when they were doing something of interest, the videos were short if not at all. The Video Highlights were the only thing that even gave you a hint of what was going on up there.

What happened to the cargo bay cameras when everyone up there was asleep?

They used to show live earth views during sleep periods but lately this has not been happening at all.

The last SAREX mission was only good for those who lived south of the 28th para. because the orbiter never faced north anytime during that mission. I guess thats o.k. if you live in Texas, Florida or any of the southern states. I would have liked to have at least had a shot at getting a QSL card for the 25th aniversary of the APOLLO lunar landing. I realize that not everyone can make contact during a SAREX mission but it gets a little frustrating when you get cut entirely out of the loop.

If I sound a little bitter, it's only a small token of what many of us are feeling about the last few SAREX missions... I am only passing on some of the complaints that I have heard along with some of my own... I hope that NASA is listening and takes the time to acknowledge this amoung all of the other problems that they have to deal with.

In closing, I seriously hope that this improves over time and all amateurs are allowed to become active participants in the space program, not just selected groups.

- Mike -
WD6EFM
Sacramento, Ca.

P.S. It was not my intent to discredit those who work directly with SAREX at NASA... I know that they work very hard to make SAREX work for ALL amateurs. Keep up the good work and try not to forget the rest of us who want to participate too!

Worked the Shuttle last night on Packet, still all goosebumpy!

If it were real easy to work the shuttle, I don't think it
would make the contacts as exciting as they are. My hats off
to everyone behind the SAREX missions, thanks very much.

From article <rtm-180994084349@kip-71.apple.com>, by rtm@newton.apple.com (Bob Martin N6MZV):
> Well, packet *finally* got running on STS-64. I'd appreciate copies of
> beacon texts or other packet copy after 23:55 PDT on 9/17/94 (that's 06:55

I copied this QSL beacon at about 0350Z 18th Sep.
If anyone copied it earlier than this I'd really like to know if it's got me in there as number 11 or 15. And whether a later beacon shows me as #99.
I had to scramble to get the packet set up as I was expecting more voice and didn't have the TNC configured properly and also the shuttle is very difficult to copy up here, especially when it sends out long packets like the QRZ and QSL which get nailed by a fade.

STS-64 SAREX Is Active On Packet Radio

After several days of being silent on packet, the STS-64 SAREX payload came alive today on packet. The general reason given for the silence was to conserve electrical power inorder to extend the mission of STS-64 for another day. KA3HDO reports that the SAREX packet payload was turned on today and will remain on until it has to be stowed for landing. Listen for on the packet downlink link frequency of 145.550 MHz and remember that the the uplink is on 144.490 MHz. However, before transmitting, listen to the downlink for voice operations as voice operations are always a possibility.

[The AMSAT News Service (ANS) would like to thank Frank Bauer (KA3HDO) for the information which went into this bulletin item.]

AMSAT-NA Board Election Results Announced

Martha Saragovitz, AMSAT's Corporate Secretary, announces the results of the recent election to fill three seats on the organization's Board of Directors.

A total of 1548 ballots were received at AMSAT Headquarters by the September 15th deadline.

The vote was:

Tom Clark W3IWI 1199
Andy Mac Allister WA5ZIB 837
Keith Baker KB1SF 781
Bob Myers W1XT 614
Lou McFadin W5DID 573

John Hansen WA0PTV 505

Therefore Tom Clark and Andy MacAllister are returned to the Board and Keith Baker replaces Joe Kasser (G3ZCZ). Bob Myers becomes the First Alternate and Lou McFadin the Second Alternate. The alternates serve until the next election, one year form now.

Thus, for the next year, the AMSAT-NA Board will consist of:

Keith Baker KB1SF
Tom Clark W3IWI
Dick Daniels W4PUJ
Junior deCastro PY2BJO
Rbt. Diersing N5AHD
Andy MacAllister WA5ZIB

Argentine Antarctic Satellite Operation

On 14-SEP-94 an Argentine team sailed on an icebreaker carrying a portable MICROSAT station and two AMSAT volunteers, LU2AOQ and LU9AFP. The objective is to demonstrate digital satellite communication including the transfer images and data files to those stationed in Antarctica with an aim of eventually placing permanent amateur satellite stations in Antarctica.

Such a demonstration is made all the more relevant because normal HF communication between Antarctic bases and the South American continent are frequently interrupted, especially during this portion of the solar cycle.

The ice breaker is working under callsign LU7AA, and will be underway for about one week. In addition to operating on the MICROSATs, the AMSAT volunteers will working the RS satellites.

All the amateur community is invited to participate in this experiment.

The portable station being used was assembled by LU5EO.

[The AMSAT News Service (ANS) would like to thank Gustavo Carpignano (LW2DTZ) of AMSAT-LU for the information used in this bulletin.]

JARL Sponsors A Special Event Station

In connection with the International Telecommunications Union 14th Plenipotentiary Conference to be held in Kyoto Japan from 17 September to 14 of October, the Japan Amateur Radio League, has set up a special amateur radio station using the call 8N3ITU. The station is available to all Conference attendees who are licensed amateurs in their particular countries. Many Post and Telecommunication Ministers and their assistants from all over the world are to attend this meeting. The station will be capable of operating all modes from 1.9MHz to 1200 MHz, including AO-13 and other satellites.

Amateurs are reminded that 8N3 is not a new country, just JA, and that this is not a DXpedition. Japanese operators will be present but only to assist operators from foreign countries. They are instructed not to handle "pile-ups." Amateurs are asked to please not disturb the operation of 8N3ITU and please not engage in DXpedition style pile-ups. QSLs for contacts with 8N3ITU will be sent via the JARL bureau. For those who cannot use the bureau, they may send cards and an SASE to 8N3ITU,JARL-KANSAI 3-8-31 DAIDOU,TENNOUJI,OSAKA 543, JAPAN.

JAMSAT played a very important roll in achieving satellite capability for 8N3ITU. It is hoped that this will demonstrate, to the delegates, the possibilities and importance of Amateur Radio Satellites. Hopefully it may influence some governments, of countries where satellite operation is inhibited, to open the VHF and UHF Bands for Amateur Satellites Usage.

Although this operation is coming at a time when AO-13 is not in its best orientation and the station may be hampered by a long coax run, the JAMSAT volunteers are doing their best to put on a successful satellite demonstration for some influential people. AMSAT wishes them luck in this worthwhile project.

JAMSAT expresses special thanks to the Japan Ministry of Postal and Telecommunication and JARL-HQ for this opportunity.

[The AMSAT News Service (ANS) would like to thank Mikio Mouri (JA3GEP) for the information used in this bulletin.]

N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

FO-20: The FO-20 command team has mentioned before that digital mode operation of the bird will be continued for a while because mode switching between digital mode (Mode-JD) and analog mode may cause some problem of onboard command system. [Kazu Sakamoto (JJ1WTK)]

AO-16: WD0E reports that as of 18-SEP-94 the team of WJ9F, WD0E and VK7ZBX is continuing the software relaod of AO-16. Last night the first stage was completed and PACSAT is under full software control and sending normal telemetry. Loading of the remainder of the software, including the BBS, will probably take a few more days. [wd0e@amsat.org]

LO-19: After of being out of service since May, LUSAT-OSCAR-19's BBS is now working again! Last May, for some yet determined reason, the BBS crashed during a pass over South America near a region know for its high-energy particle activity called the South Atlantic Anomaly. Last Sunday, 11-SEP-94, AMSAT-LU ground controllers were able to bring LO-19's BBS back on-line. [LW2DTZ]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a

regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

1473. Re: SAREX Packet??? Maybe!!

In article <35gum4$7m2@ixnews1.ix.netcom.com>, malari@ix.netcom.com (M.A. Lari) writes:

I for one was amazed at the number of passes they made with someone on the radio. I think they did a great job doing all they could to make it as easy as possible for us hams on the ground. (Heck, they even changed the inclination of their orbit for us northern hams!! HA!) This was the first time I really followed the ham activity, but it seemed like they went all out this time. Almost every pass I monitored had someone at the radio (except for the ones during their sleep period). I guess this was not enough for some people.
Thanks NASA!!!!!!! Next time I will make contact! KD6VYV

1474. SAREX Contact at last!!!

Finally, after several years of listening to SAREX missions and
operating satellites, I was rewarded with an FM voice QSO with
KB5SIW onboard Discovery.

At 21:35 UTC on Saturday, several area hams were surprised to hear
voice instead of packet coming from orbit. I switched to fm voice
on my Yaesu FT-736, checked power at 25 watts, and positioned my
Oscar-13 20 element crossed yagi for the point in the pass, 53
degrees local elevation. A few seconds later I was to hear my
callsign returning from Discovery.

Granted, most hams don't have Oscar gear to talk to the shuttle,
but my point that it isn't that hard to do. On the last SAREX flight,
a local ham beat me out for a packet connect using 10 watts and a
5 element FM beam on a low pass. The key is to know where it is.
Tracking programs are a dime a dozen on the net. The main thing
we have to overcome is the massive amount of traffic and QRM the
shuttle hears. Other factors such as orbiter attitude and mission
priorities come into play, but most of this can be found with
a little digging this group and the wa3nan.gsfc.nasa.gov site, and
compensated for. Personally I feel that it's all part of the game
and is part of what makes it fun and a feeling of accomplishment.

My kudos to the SAREX team and keep up the good work.

> explain if they are both suitable for Satellite packet.

A "normal" TNC is used for both low speed (1200 bps) and high speed (9600 bps) Pacsat communications along with an external modem. At 1200 bps (AO-16, WO-18, LO-19, FO-20, IO-26 satellites), the satellites transmit using BPSK modulation and is typically received using an SSB receiver (70-cm band). Uplinks take Manchester encoded packet data and use it to frequency modulate a 2-meter FM transmitter, producing FSK.

9600 bps communications (both satellite and terrestrial) use straight FSK modulation without Manchester encoding to keep the transmitted bandwidth within the passband of a NBFM receiver. BPSK is not generally used at this data rate since SSB transmitters are typically used in this application, and the narrow bandwidth of SSB transmitters precludes their use for transmitting data at 9600 bps.

> Would someone tell me what you are using for these modes and what you would
> recommend for a low budget system?

Check out the August 1994 issue of QEX for a description of my 1200 bps BPSK Pacsat Modem. The article also explains how the modem can be used for terrestrial communications, and how BPSK signals are handled and how Manchester encoding works (and the striking similarity between the two).

The NOAA-11 AVHRR failed sometime on the 13th of September. There has
not been a great deal from NOAA/NESDIS about this yet, but a brief report
indicated that the fault appeared to be electrical. Having gathered
daily AVHRR imagery from this satellite since 1989 we were rather sad to
see our old friend depart so suddenly. We even held a wake on our
roof where the HRPT antenna is housed.

The next satellite in the NOAA series, NOAA-J while on the ground or
NOAA-14 when in operation, is due for launch 4 December. Keep your fingers
crossed for this one, because if it doesn't work then we're in the ....

Newington, CT September 19, 1994
To all radio amateurs

SB SPACE ARL ARLS031
ARLS031 SAREX additional day

Astronauts To Operate SAREX An Additional Day

The SAREX Working Group reports that the postponement of Monday's shuttle landing has given the amateur community another day to contact the astronauts on 2-meters. This crew has been particularly active making random contacts throughout their flight. There will be several passes over the US between now and stowage time. The crew has indicated they will make themselves available for voice contacts during the additional day, until they have to stow the equipment again for landing on Tuesday, September 20.

Those wishing to contact the Discovery astronauts in voice mode are encouraged to listen to the downlink frequency, 145.55 MHz, FIRST before transmitting. Ground based radio amateurs need to transmit on one of the following voice uplink frequencies, 144.91, 144.93, 144.95, 144.97 or 144.99 MHz. The crew does not favor any of these frequencies. The crew call signs are KB5SIW, KC5HBS and KC5HBR.

Thanks to Lou McFadin, W5DID, of the SAREX Working Group for the preceding information.

1488. STS-64 Checkpoint #11

Newsgroup: rec.radio.amateur.space
Date: 1994-09-20 10:07:04 UTC
From: tstader@aol.com
Message-ID: <35mc88$dih@newsbf01.news.aol.com>
Source record: 26841

MacSPOC Users-

The enclosed checkpoint reflects tracking into Monday evening CDT and removes 13.2 miles of downtrack error accumulated since the last update. After Discovery's Monday wave-off from a KSC landing, both KSC and EDW deorbit opportunities will be assessed Tuesday. Although weather violations at KSC continue to be forecast, EDW conditions appear acceptable. The following sequence of deorbit opportunities is included in this checkpoint for v1.5 users. It may be input manually by v1.1 users by selecting "Maneuvers..." from the "Update" menu.

Deorbit to KSC on Orbit 174:
TIG = 10/18:49:39 MET
DVx =-206.9 fps (retrograde)
DVy = 231.9 fps (southward)
DVz = -87.5 fps (upward)

Deorbit to KSC on Orbit 175:
TIG = 10/20:22:34 MET
DVx =-209.1 fps (retrograde)
DVy =-211.7 fps (northward)
DVz =-125.4 fps (upward)

Deorbit to EDW on Orbit 176:
TIG = 10/21:53:16 MET
DVx =-219.2 fps (retrograde)
DVy =-234.7 fps (northward)
DVz = -33.9 fps (upward)

Deorbit to EDW on Orbit 177:
TIG = 10/23:26:53 MET
DVx =-227.1 fps (retrograde)
DVy = 225.6 fps (southward)
DVz = -42.2 fps (upward)

1489. Military SATCOM advice needed!

Newsgroup: rec.radio.amateur.space
Date: 1994-09-20 12:49:27 UTC
From: hpeach@ca.uky.edu
Message-ID: <hpeach.143.000CD305@ca.uky.edu>
Source record: 26843

Last Christmas I received a Grove ScannerBeam as a gift. I am now getting around to putting it
up (I have a lot of half-built kits too). My thought has been that my main use for this antenna
would be to receive military satellites in the 200-400 MHz band. To do this is going to require
the outlay of some additional cash so I have a few questions:

1) Is there enough traffic being transmitted in the clear via these birds to make the investment
worthwhile? What type of comms (i.e., would I be able to listen to the operations going on in
Haiti if I had this in place now or would I just pickup routine stuff?) can one expect to hear?

2) Is the typical mode FM, SSB, or what?

3) Is it reasonable to assume that a log periodic, 10dB preamp, and a PRO-2004 (feeding an
ICOM 745 if SSB is needed) will do a decent job?

4) WHO MAKES AN INEXPENSIVE, REMOTELY POWERED PREAMP THAT WOULD WORK
FOR THIS APPLICATION?

5) WHERE CAN I FIND AN INEXPENSIVE, LIGHT DUTY AZ-EL ROTOR FOR THIS
APPLICATION?

Please reply via e-mail as I do not regularily read this group.

Slight correction required here. The volcano eruption is in Papua New Guinea
not New Zealand. The two countries are an awful long way apart !

AVHRR failed 23:30 UTC on 13 September.

1493. Windows satellite logging program

Newsgroup: rec.radio.amateur.space
Date: 1994-09-20 22:58:52 UTC
From: tboza@sedona.intel.com
Message-ID: <35npfc$gl2@chnews.intel.com>
Source record: 26847

Does anyone know where I can acquire a Windows logging program
that is designed for satellite operation? I want to track satellite
awards (WAS & DXCC) on each of the differnet birds and satellite modes
(SAT MODE: A, B, J, S, etc..) (QSO MODE: SSB, Packet, CW etc..)
Today Im using an EXCEL spread sheet because all the Windows based
logbook programs currently available are designed for HF operation.
HF logging programs don't take in consideration all the additional
satellite options, modes and freqs.

Tnx and 73s

Tom WB7ASR...

1494. Satellite frequencies listing

Newsgroup: rec.radio.amateur.space

Phil--

You didn't mention at what times you were listening, but those
particular passes may have been at times when the astronauts were
asleep. And they didn't have the packet system on until a couple
of days before landing. They were very active on voice when they
were awake; I heard them on almost every pass over the Bay Area.

>I'm listening on 145.55 and xmitting packet on 144.49.

Don't ever transmit--even on a different frequency--until you're
sure that there are SAREX operations (voice or packet) in progress.
It's at least a waste of time, and if your transmit frequency is
shared with other users (e.g. the voice uplink freqs., which are
used for packet in most of the U.S.), you'll be interfering with
other hams to no purpose.

73,
Patty

>She did not call CQ, and From what I understand, "YOU" have to call CQ,
>and they (Susan) will answer you.

No, all you have to do is transmit your callsign *after* you hear
signs of voice operations from the shuttle. The astronauts are trained
by the SAREX folks to operate contest- or DXpedition-style. They call
CQ briefly and then work through the resulting pileup. They'll only call
CQ again if the pileup disappears (not likely :-)).

NB: Susan Helms isn't a ham; she was using Dick Richards' callsign.
I had the great pleasure of talking to her on Thursday--my first-ever
voice contact with the shuttle.

While squawking about NOAA 11 problems ? (18 Sep 94 17:17:11),
Lver@ksu.ksu.edu babbled this to All:

Lv> Message-ID: <35ie9m$545@matt.ksu.ksu.edu>
Lv> Newsgroup: rec.radio.amateur.space
Lv> Organization: Kansas State University

Lv> I tries to collect a picture from NOAA 11 on 17 Sept, at about 2230
Lv> UTC. ll I got was a black screen. NOAA 11 was transmitting its gray
Lv> bar data but no APT images (Vis and IR). I was receiving at 137.62
Lv> MHz.

Lv> Has anyone heard about any trouble with NOAA 11?
Lv> Have I been missing out on the news?

NOAA 11's AVHRR has died - apparently some electronic problem.
Because the AVHRR data is used to generate the APT pictures, there is no
longer any of the latter.

NOAA 9 has been re-activated, and NOAA 10's APT (not sure about the
rest of the stuff available) has been turned off, probably because it is
conflicting with NOAA 12.

FYI - NOAA-J is scheduled to be launched Dec. 4.

Source record: 26850

The Society of Amateur Radio Astronomers (SARA) now has a home page on the Web, with information about how to get started in amateur radio astronomy, where to get components and software, and an index of SARA Journal articles since 1983. The URL is:

http://IRsociety.com/0c:/sara.htm|/

(Note, because the Web server is DOS based, the URL ends in .htm|/ (where '|' is the vertical pipe symbol) rather than the standard .html/. Also, the '0c:' is the number zero, rather than the letter 'O' which has caused some confusion!)

The Society also operates a free BBS at (608) 835-9605.

SARA is an international non-profit organization with 325 members, and is open to all who are interested in amateur radio astronomy.

Best wishes,

Bob Lash & Mike Fremont

1499. Packet Radio (SAREX)!!!

Newsgroup: rec.radio.amateur.space
Date: 1994-09-21 08:24:44 UTC
From: malari@ix.netcom.com
Message-ID: <35oqkc$qnv@ixnews1.ix.netcom.com>
Source record: 26851

For those of you who read my article, "(SAREX) Packet Radio MAYBE!!!", I rec'd many responses to it in various forms, some supportive, some critical and then there was this response that really hit home. As you can see, Gerry spent a fair amount of time to prepare this letter and I felt that I couldn't keep it to myself. He clearly represents the "SPIRIT OF AMATEUR RADIO" and did a great job in explaining SAREX to me... Thanks Gerry, I hope all of you enjoy this as much as I have.

73's to all

Mike

WD6EFM - Sacramento, Ca.

<start of forwarded message>
==========

Mike, I feel like maybe a personal response might help...

In article <35gum4$7m2@ixnews1.ix.netcom.com> you write:
>Well, after spending many late nights waiting for the shuttle to pass
>over.. hearing nothing time after time, it's real nice to know that
>they "MIGHT" turn it on for the last few orbits... in fact, trying
>to work the shuttle has gotten as bad as trying to find an open lane
>at a bowling alley. The only way you can bowl anymore is to become a
>member of a league. Do the members of the amateur radio community have
>to go back to elementary school to be allowed to talk to the shuttle
>anymore? STS-64 was more boring than watching the crystals grow in
>previous missions.

Let me start with a caveat: I'm off for several years going back to school... trying to get into medical school. Officially, I'm on leave without pay from my job as a contractor at NASA's Johnson Space Center. I am still a co-investigator on SAREX. I'm no longer involved in the day-to-day warfare iwith SAREX, but I did ALL the training for over 6 years, and am intimately familiar with the problems the Team faces from management and the Astronaut Office...

Over time, the missions have gotten more involved. This serves to severely impact crew time for SAREX operations. Therefore, when the crew are all busy, it gets harder for them to look out the window, say to themselves, "Selves, I think I'll play SAREX during this CONUS pass," and just do it. On missions when there are a lot of maneuvers, the Pilot and Commander are pretty busy. This time, that was 2 of 3 licensed operator (Dick, SIW, and Blaine, HBS). During EVA, they are all busy playing safety observer, copying comments from MCC, etc.

Unfortunately, SAREX remains a secondary experiment. This means that we can be demoted in priority with little notice. Further, our sponser at NASA HQ is the Office of Education. Of all the SAREX Goals and Objectives, the conversations with school kids have a higher profile than talking to Joe Ham. And, let me be candid. In dealing with the astronauts, I came to the realization that with some notable exceptions, the crews also see this as a unique opportunity to have some positive impact on the kids. It took some serious soul searching to get back the reality that talking to the general ham population was THAT important, and we had some raucous SAREX team meetings where I took the unpopular position that we should carry SAREX even if all we did was the school contacts... and crew personal contacts... In fact, for some period, when there was some official flak from the Cief of the Astronaut Office (Dan Brandenstein, at that time), I was on record as telling the crew in training that while it'd be nice if they'd do General QSO passes, it wasn't THAT important. And before the flames come, realize that I was working from a different, and possibly incorrect perspective, I don't know. I do know I've modified my position over time, though.

On this mission, the electrical power constraint that prevented packet operations was considered very real by mission management. So real, in fact, that as late as 5 weeks before launch, we considered cancelling SAREX operations completely, because we were being told we'd just get school passes, ONLY on batteries, and nothing else. That was not an acceptable alternative to us. Nor was it to the crew. Commander Dick Richards called in some markers and got a little relief on the position. Further, from what I understand, Dick was the one who got permission to turn on PACKET, after the SAREX representatives in Mission Control (yes, Virginia, we maintain a full-time presence there during SAREX missions) were turned down. Further, Dick elected to delay stowage by almost 8 hours on his own initiative. We decided that, if we made an issue of it, some paper pusher might make him stow on-time... we sat quietly.

One more note: We schedule a primary and a backup pass in the Crew timeline for each school. Lou McFadin, the Principal Investgator was able to convince me, and subsequently the Astronaut Office and NASA Mission Management that if the school contact was successful on the primary pass, rather than giving the backup pass back to the mission, we would retain it for General QSO Operations. This actually put quite a bit of operating time into the timeline for general ops that never was there before. Packet Ops were ALWAYS intended to be there for when voice ops were not possible... In fact, the original intent of packet ops on STS-35, where Ron Parise (WA4SIR) wore us down to redesign the hardware to include packet, was to have a no-crew-time-impact operating mode, since he was so busy. The fact that we were able to make it such a power miser was a bonus (Thanks, Heathkit, for the HK-21's!).

>At least they showed something on NASA SELECT. This time, even when
>they were doing something of interest, the videos were short if not
>at all. The Video Highlights were the only thing that even gave you a
>hint of what was going on up there.
>
>What happened to the cargo bay cameras when everyone up there was
>asleep?

>
>They used to show live earth views during sleep periods but lately
>this has not been happening at all.

Even during Shuttle missions, NASA shares TDRSS time for communications. Between the mandatory data downlinks (on the order of 95 mbits/sec), the Deep Space Network's requirements, Orbiter communications, and experiment data downlinks, the ~300 Mbits/sec bandwidth doesn't last too long. A lot of the payload bay earth views were predicated on Earth-Obs mission requirements in the past, so NASA targetted them. Further, during Spacelab missions, Marshall Space Flight Center frequently has data requirements for PLD BAY camery views, just specifically for background. My personal opinion: The NASA/JSC folks are so proud of the Silicone graphics DMOS display (that simulation of the shuttle including accurate attitude info and ground track) that they've forgotten how captivating the view out the window is! I intend to talk to them later this week about that...

>The last SAREX mission was only good for those who lived south of the
>28th para. because the orbiter never faced north anytime during that
>mission. I guess thats o.k. if you live in Texas, Florida or any of
>the southern states. I would have liked to have at least had a shot
>at getting a QSL card for the 25th aniversary of the APOLLO lunar
>landing. I realize that not everyone can make contact during a SAREX
>mission but it gets a little frustrating when you get cut entirely
>out of the loop.

Sorry.... Realize that I didn't get a contact, either, last time... Between classes, and weekends in MCC, I was NEVER near a radio when they came overhead. And that's the way it's gone for ME the whole project. My first SAREX contact was with STS-45 during an unscheduled pass... one of the crew wanted to ask us some questions, and as that had been happening, we staffed W5RRR (JSC's ham club station). Since this one was at 0-dark-30, I was told by the FLight Director to leave my console and go cover it... I did, and talked to Brian Duffy for my first Shuttle contact... From his voice, I don't know if he or I was happier (STS-45 is the fondest memory I have of crew training... one of the best groups of humans I've ever known). My other contacts have been a single packet QSO on STS-50, and voice contacts on STS-55, -56 and -64... And I'm supposed to have an inside track according to some folks Ive seen posting...

>If I sound a little bitter, it's only a small token of what many of us
>are feeling about the last few SAREX missions... I am only passing on
>some of the complaints that I have heard along with some of my own...
>I hope that NASA is listening and takes the time to acknowledge this
>amoung all of the other problems that they have to deal with.

Color it noted... I will make a point to bring this up to the rest of the Team. We are cognizant of the folks on the ground, and would like to see more general QSOs. I still maintain my position that the educational aspect is the most important, but I do realize how important it is to get the crews talking to the population in general as a means of maintaining support for the program (both Shuttle AND SAREX!).

>In closing, I seriously hope that this improves over time and all
>amateurs are allowed to become active participants in the space
>program, not just selected groups.

We do still have to compete for the crew's time. We're real lucky to have folks like Steve Nagel (N5RAW), Ken Cameron (KB5AWP), Jay Apt (N5QWL), Dick Richards (KB5SIW), and Ellen Baker (KB5SIX) who are so enthusiastic that they go out of their way to make time for SAREX. We also have some crew members who are so motivated by the education aspect that THAT alone was their reason for getting the ticket. And some who were browbeaten into it... but that's another story (ask me later about the crew whose intraoffice routing and approval slips were a list of callsigns and "OTHER").

>P.S. It was not my intent to discredit those who work directly with
> SAREX at NASA... I know that they work very hard to make SAREX
> work for ALL amateurs. Keep up the good work and try not to
> forget the rest of us who want to participate too!

Thanks... We DO try...

Hope this offers some solace. I can understand the frustration, and wish there was something I could do about it. I actually feel that, when I get back down there I might be able to have more impact on some of the issues, like crew training and attitudes, as well as some of the bureaucracy that I deal with better than some other Team members...

1501. RS-10 and license classes

Newsgroup: rec.radio.amateur.space
Date: 1994-09-22 18:39:00 UTC
From: billkuhn@vtaix.cc.vt.edu
Message-ID: <35sj04$al3@solaris.cc.vt.edu>
Source record: 26854

I have a question regarding license classes required to use
satellites such as RS-10. Any help is greatly appreciated.
I am giving a talk on satellites to our club tomorrow
evening, and inquiring minds will want to know...

The uplink to RS-10 is on 2 meters. The downlink is on
10 meters. Is it legal for a No-Code Tech to transmit
to the satellite and have his/her signal transponded to
10 meters? That is, can they use the satellite for QSOs?

The answer to this is certainly not obvious to me. The no-code
is licensed to use 2 meters, but not 10 meters. They are
transmitting on 2 meters, which is perfectly legal, but
they are also transmitting (indirectly by way of the
transponder) on 10 meters which does not seem legal.

I am a member of AMSAT and have numerous books covering the
satellites, but this question seems to not be addressed
anywhere! It seems like this would be one of the first
things one would want to know.

If you know the answer, please post it together with a
source of where this is clearly spelled out (maybe buried in
the FCC regs somewhere, hopefully...).

Thanks in advance for your help.

The no-code technician is limited in terms of not being the control
operator for a 10 meter station. Since he is not the control operator
for RS-10, he is certainly allowed to use RS-10 as the only station
he is the control operator for is his 2 meter transmitter. So yes,
a no-code technician *can* use RS-10.

From part 97.3

(6) Automatic control. The use of devices and
procedures for control of a station when it is transmitting so that
compliance with the FCC Rules is achieved without the control operator
being present at a control point.

(11) Control operator. An amateur operator designated
by the licensee of a station to be responsible for the transmissions from
that station to assure compliance with the FCC Rules.

(37) Space station. An amateur station located more
than 50 km above the Earth's surface.

97.9 Operator license. - (a) There are 5 classes of operator licenses: Novice, Technician, General, Advanced and Amateur Extra. An operator license authorizes the holder to be the control operator of a station with the privileges of the operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

From part 97.109 Station control.

(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations transmitting RTTY or data emissions on the 6 m or shorter wavelength bands, and stations specifically designated elsewhere in this part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

From part 97.113

(f) No amateur station, except an auxiliary, repeater, or space station, may automatically retransmit the radio signals of other amateur station.

From part 97.207

(d) A space station may automatically retransmit the radio signals of Earth stations and other space stations.

So the space station operates in automatic control and the user of the satellite is *not* the control operator. As such, 10 meter privileges are not required.

lver@ksu.ksu.edu (Lloyd Paul Verhage) writes:
>
>I take it then, that when the AVHRR failed, it included the APT data?
>Does APT come from AVHRR?
>

Yes. The raw stuff which comes out of APT comes from the AVHRR data,
cunningly processed to give fairly even resolution over the wide
angle swath. The main instrument is plus or minus 55 degrees and so
the resolution of the AVHRR degrades severely from nadir to edge.

You can probably still hear APT, or the HRPT data for that matter,
but it is all rubbish imagery (when I looked early this week).
However, cheer up, there is still NOAA-12. NOAA-9 is a bit punch
drunk, but generally useful.

1504. Static satellite tracking device

Newsgroup: rec.radio.amateur.space
Date: 1994-09-23 08:10:35 UTC
From: caralt@gaig.upc.es
Message-ID: <35u2hrINNgo0@diable.upc.es>
Source record: 26856

Dear Sir,
At the Telecommunications School of the Polytechnical University of Catalonia, Barcelona, Spain (namely: "Escola Superior d'Enginyers de Telecomunicaci&#65533; de Barcelona, Universitat Polit&#65533;cnica de Catalunya, Barcelona, Spain) we are developping a project on Amateur Satellite Communications, which consists in a full design of a static antenna for satellite tracking. By static we mean that no part of the antenna moves while tracking is in progress. The system is based on the theory known as "Phased Array": the movement of the beam is not mechanic but electronic.
This technology is spreading quite rapidely because of its reliability and performace, specially in the field of RADAR and professional satellite links. But as far as we know, the usage of such devices has not been put into practice by radio amateurs. All the systems that are operating are based on crossed rotating Yagi; its simplicity is obvious but all the control system is not: two precise rotors (quite expensive), computer control, complex programs to lock on desired satellites, maintenance, etc.
Our system is totally reliable and more effective than those used by radio amateurs. We believe that our project is the first of this nature and we would like to share all the information that we have obtained with other people interested. New information on this field will be welcome. We would be very grateful if you could spread this news anywhere you considered, as well as our E-mail.

Yours faithfully.

=========

MONDAY SEPTEMBER 26, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* MACHHOLTZ-2 NEWS *
====================
Astronomers are keeping a watchful eye on Machholtz-2, a comet discovered to be racing toward the Sun by an American scientist last month. Shortly after the comet was discovered, observers reported the comet had broken up in a manner similar to comet Shoemaker-Levy-9 before its impact with Jupiter in July, and there is some concern the fragments of comet Machholtz-2 could impact the Earth in the future. Five fragments have been spotted so far, and all are heading for Earth's orbit. However, astronomers warn it is extremely difficult to predict the long-term behavior of the comet fragments and advise the comet will be monitored closely.

* NOAA-11 FAILURE *
===================
Reliable sources report that NOAA-11's AVHRR failed at 23:30 UTC on 13-Sep-94. A brief report indicated that the fault appeared to be electrical. NESDIS personnel have been working diligently to solve the problem, but it seems that APT as well as high resolution images are no longer available from NOAA-11 because of this failure.

* AO-16 RELOAD COMPLETE *
=========================
As of 0330 UTC on 21-Sep-94, the AO-16 File Server is open and returned to general use. The AO-16 Command Team would like to thank everyone for their patience during this important "Preventive Maintenance" reload. Thanks go to the AO-16 Command Team consisting of WJ9F, WD0E, VK7ZBX, KB5MU, as well as NK6K and WB9ANQ.

[Info via Russ Platt, WJ9F]

* NASA NEWS VIA E-MAIL *
========================
NASA press releases and other information are available automatically by sending an Internet electronic mail message to domo@hq.nasa.gov. In the body of the message (not the subject line) users should type the words "subscribe press-release" (no quotes). The system will reply with a confirmation via E-mail of each subscription. A second automatic message will include additional information on the service. Questions should be directed to (202) 358-4043.

* MIR NEWS *
============
On 09-Sep-94 Malenchenko and Musabayev performed an EVA for the first time. The duration of the EVA was more than 4 hours (a reliable source even spoke about 5 hrs 2 mins.). During the pass in orbit 48915, between 1200 and 1207 UTC when Mir was VHF of observers in Europe, the cosmonauts reported the closure of the hatch at 1202 UTC. During this EVA they inspected the outside of the entire orbital complex, installed experimental materials on outside platforms for exposure to open space and removed other experiments of that kind for storage inside the complex. They repaired the damaged thermo-isolation layer on the transition section (P.Kh.O.) of which a 30x40cm piece had been torn away during the collision with Soyuz-TM17 in January 1994. The inspection made clear that the toughes of the freighter Progress-M24 during its second approach on 30-Aug-94 did not cause significant damage.

On 13-Sep-94 the cosmonauts worked in open space for a second time. The EVA lasted 6 hours and 1 minute between 0631 UTC (opening of the hatch) and 1232 UTC (closure of the hatch). The cosmonauts performed many minor repairs, replaced bolts, screws, etc. of platforms and equipment on the outer surface of the complex. They also spoke about an old antenna. Activities of that kind must be done now and then, but have been often neglected during EVA's due to more important matters. The cosmonauts also did some preparatory work aimed at the future transfer of the solar batteries from Kristall to Kvant-1. This transfer has been put back again to the beginning of 1995.

Radio communications during the EVAs were copied in Europe on a frequency somewhat lower than normal, 143.622 MHz, shifting by Doppler to 143.617 MHz. Listeners in Western-Europe, including the UK, who monitor MIR traffic during EVAs often experience heavy interference caused by cross-modulation from an airtraffic control frequency.

>The uplink to RS-10 is on 2 meters. The downlink is on
>10 meters. Is it legal for a No-Code Tech to transmit
>to the satellite and have his/her signal transponded to
>10 meters? That is, can they use the satellite for QSOs?

Of course, the tech is only transmitting on 2m.

Same is true for even novices (one ham in Bellevue has his HEO sat station coupled to a 220Mhz repeater, so all (including novices) can work the satellites!

Same is true of coupled repeaters (say 2m and 10m).

In fact, sats are an excellent way to introduce techs to DX.

Certainly worked for me as a class B in the UK!

In article <35gum4$7m2@ixnews1.ix.netcom.com>,
M.A. Lari <malari@ix.netcom.com> wrote:
>==
>Well, after spending many late nights waiting for the shuttle to pass
>over.. hearing nothing time after time, it's real nice to know that
>they "MIGHT" turn it on for the last few orbits...

You make it sound as though the SAREX folks were the ones who decided
to keep it off. Didn't you hear any of the discussions about power
conservation during the mission? Don't you think that the hams would
have turned on the packet robot in an instant if they'd been allowed to?

> Do the members of the amateur radio community have to go back to
>elementary school to be allowed to talk to the shuttle anymore?

That's an awfully snide comment. I suspect that you have never
personally attended a shuttle school contact. If you could see one
(perhaps you could volunteer to help a local school apply?), I think
you'd be so enchanted and swept up by the kids' excitement that you'd
see why NASA gives these contacts higher priority than freestyle
operations. Do you really think that you making a one-person contact is
more important than getting 50 or 100 kids excited about space and
amateur radio, *and* getting the event splashed all over the local media?

I never worked the shuttle myself until just a few months ago (a packet
contact on STS-59), but I was privileged to attend a school contact in
San Diego a couple of years ago, and it was one of the highlights of my
amateur radio life.

>At least they showed something on NASA SELECT. This time, even when
>they were doing something of interest, the videos were short if not
>at all. The Video Highlights were the only thing that even gave you a
>hint of what was going on up there.

I saw live footage of all of the experiments (LITE, Spartan, SPIFEX)
at one time or another, not just on the flight-day highlights shows.
And of course, even C-SPAN and CNN carried parts of the SAFER EVA.

>What happened to the cargo bay cameras when everyone up there was
>asleep?

Boy, I sure like those, too! I can easily stay up till one or two in
the morning watching those beautiful shots of the earth. Perhaps the
bandwidth on the NASA satellites was taken by other projects this time. :-(

>The last SAREX mission was only good for those who lived south of the
>28th para. because the orbiter never faced north anytime during that

>mission. I guess thats o.k. if you live in Texas, Florida or any of
>the southern states. I would have liked to have at least had a shot
>at getting a QSL card for the 25th aniversary of the APOLLO lunar
>landing. I realize that not everyone can make contact during a SAREX
>mission but it gets a little frustrating when you get cut entirely
>out of the loop.

I'm sure that NASA would be happy to accept your check for the extra
fuel necessary to put every mission into a 57-degree orbit. I don't
know the exact department to which you should send the money, but
probably the folks over on sci.space.shuttle could help you.

BTW, a 28-degree orbit does not mean that you have to be between
28N and 28S to see/hear the shuttle.

>If I sound a little bitter, it's only a small token of what many of us
>are feeling about the last few SAREX missions...

It's one thing to be frustrated; it's another to choose to get bitter
about it. I was also extremely frustrated during STS-65 because of the
low-inclination orbit. I copied one--count them, one--packet from the
SAREX robot during the *entire* mission. (And I didn't even write down
the time for an SWL card because it was early in the mission and I was
sure I'd copy more traffic later. C'est la vie.)

But for heaven's sake, I don't go around whimpering that NASA or SAREX
should adjust their missions for my benefit. I just say to myself, "Oh
well, there's always next time." And in my case, the next time (STS-64)
brought not only a packet contact, but my first-ever voice contact with
the shuttle (thank you, Susan!). So you lose some, you win some.

Amateur radio is full of challenging situations. (Go try making DXCC
with a porch-awning antenna sometime.) You can either learn to make
the best of a bad situation--which sometimes means totally failing to
get what you want--or you can keep lashing out unthinkingly. It's
your choice.

I am wondering if any of the transmissions received by the SETI project are
available for on-line downloading and analysis by amateur astronomers or
radio enthusiasts. Anyone aware of this possibility? Thanks.

1512. SAREX WWW HomePage and STS-64

Newsgroup: rec.radio.amateur.space
Date: 1994-09-24 00:50:19 UTC
From: hrsblackwell@hrs.gsfc.nasa.gov
Message-ID: <hrsblackwell-2309942050190001@n3kwu.gsfc.nasa.gov>
Source record: 26761

Hi,
The Goddard Amateur Radio Club assisted the Eisenhower Middle School in Laurel, MD
with a SAREX direct contact during STS-64. If you'd like to see photos from this effort as well
as a couple of sound bites recorded during the contact (students asking question then
astronaut responses), try the following URL:

http://hypatia.gsfc.nasa.gov/sarex_mainpage.html

I can tell you firsthand that the SAREX program is a good one and represents the best in
what Amateur Radio can provide in public service. Teachers, parents, and students that
participated, as well as members of our club were very much moved by the experience. Several
parents were in tears and the children (those that asked questions and those there to watch)
were estatic to say the least.

RS 10 License.

About the problem of transmitting on 10Meters through RS10:
I am a no-code ham, and i wished to "test" some satellite communications before buying a better equipment. The easiest way was RS10.
I also wondered if it was legal. I looked for an answer in many books.. No answer !!
So i phoned the REF , and talked to them about my problem..
The answer was (in fact): You don't have the right, but you can do it..

This is a french point of view ! And that maybe explains why nobody deals with this problem in books.. So i made my QSO on RS10.. And heard some other no-code hams !

You will also need to connect to R0MIR-1 not R8MIR-1. I also believe
there is discussion of changing freqs. But as of 2 days ago, you can
do it with a 1/4 wave and handheld in Brisbane, AUSTRALIA

Are there any ham-balloon folks on the net? If so, do you have upcoming
launches scheduled? Is there a central registry for this kind of
information? Thank you.

PS-The October 94 QST has a remarkable photo (page 102) of a balloon
bursting at high altitude.

Congrats Patty!

And just a minor correction. Dick Richards's call sign is KB5SIW, and
if Susan was using the radio then he was the control operator with
her using his call. I heard Dick, Jerry and Blaine at various times
during the mission in voice, but I don't think they heard me.

I did make it quite clear to Dick Richards that I wanted him to hear
my call sign from orbit before they landed. Maybe that's why they
diverted their landing to 3000 miles away from me? ;)

The Clear Lake Amateur Radio Club (CLARC) in SE Houston is planning a
balloon launch on OCT 9th.
It will carry 2m packet, 2m beacon, 10mdsb beacon 28.322.

As launch date approaches I'll post more information.

This launch is for NOSTS-1 (Near Outer Space Transportation System)

1526. The HamSat Handbook- has the satellite Freqs ur looking for

Newsgroup: rec.radio.amateur.space
Date: 1994-09-26 13:53:27 UTC
From: wwg@coutts.UUCP
Message-ID: <403@coutts.UUCP>
Source record: 26792
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc

I've seen many posts over the months requesting satellite frequencies of one satellite or another. I just got my copy of "The HamSat Handbook" by Anthony R. "Tony" Curtis, K3RXK this morning. Flipping through this book I am pleased to see an up to date (Feb 1993) description of all OSCAR satellites, their history etc.

Chapter 1 covers the early history, titled "The First Space Satellites".

Chapter 2 "The Story of Orbital Satellites Carrying Amateur Radio" discusses the history of all OSCARs to 1993+.

Chapter 3 is devoted to modes and frequencies used by the satellites. (This would be the reference material that many are seeking, although chapter 2 also provides a fair bit of good information).

Chapters 4 and 5 covers Space stations and SAREX.

And finally chapter 6 covers Balloons, meteors and EME etc.

To recap, if anyone wants more information on what's available up there, I think that this is one very good source for amateur radio enthusiasts.

The HamSat Handbook, (I'm not affiliated, just a satisfied
by Tony Curtis K3RXK owner of the book!)

1527. Oscar 10

Newsgroup: rec.radio.amateur.space
Date: 1994-09-26 15:03:17 UTC
From: t1terryb@cascade.ens.tek.com
Message-ID: <366nrl$ev@cascade.ens.tek.com>
Source record: 26781

Is oscar 10 still working? This weekend according to my stsorbit it would of had a tremendous coverage of the northern hemisphere and I was wondering if it is still operational.

Got to work my first few qso's on RS-12. Was a kick. Like being in a contest with only a few minutes left. Of course, keeping my hand off the tuning know while transmitting was something I had to learn.

Terry, KI7M

1528. Re: Packet Radio (SAREX)!!!

Newsgroup: rec.radio.amateur.space

Source record: 26779

Gerry, Mike-

The SAREX crew does a great job, and provides us with a lot of challenges, some of them unintended.

On the problem of 28 degree orbits, I took this as a challenge, and after running predictions for my location in northern CA (37.317302 N 122.055194 W) I got up in the middle of the night for many nights for "good" 9 degree elevation passes. I learned a lot about my equipment and how to best use it. I also met a number of other hams in the area and in Southern California who were trying to work the Shuttle. I managed to make contact, with simple equipment, after a lot of work.

The problem with this last mission (IMHO) was one of not setting expectations properly (and early). I didn't see any word preflight or early in the flight that SAREX activity was going to be constrained due to power budgets- I only saw this very late in the flight.

What I'd appreciate seeing, either preflight or very early in the flight, would be a SAREX mission profile, posting information such as expected MET/orbit for deploying SAREX, expected operation (e.g. lotsa voice during the day and packet during sleep periods), when SAREX will be restowed, and for us MacSPOC users, which windows SAREX will be using.

I'm looking forward to the next mission in October-

Hello Don,

Try "OrbiTrack," it's a shareware sat tracking programme for the Mac
and includes rotor control using the KR-101 interface.

You can download a copy from,

ftp.demon.co.uk /pub/ham/mac

You'll also find a pretty large selection of other Ham programmes for
the Mac in the same directory.

Regards,

Sean.

You might try Tiger Software at 800-238-4437. A catalog I received from them listed such a CD. It is titled Murmers of Earth and comes in DOS and Mac versions for $39.95 plus S&H. I don't work for the folks nor have I ordered anything from them so can't recommend them either way.

> Now I know this isn't the NASA store (if one exists)
They do in Houston. Had some fun stuff in the store.

Good Luck,

Marty, I logged on here hoping to find some newsgroups myself. I'd really
appreciate having any you find passed along. I havn't found the one you
mention for keps up-dateds yet. It would be nice to get really up to the
minute data for the SAREX missions.

I've tried sat-trak-102 and OrbiTrack. Couldn't master the Keps for SatTrack without reading the documentation, but had no trouble with OrbiTrack. I don't think either will automatically drive your rotators.

You can find a copy of MacSPOC v1.1 (shareware) at,

ftp.demon.co.uk /pub/ham/mac

or directly from the author Daniel R. Adamo
<adamo@kn5f.jsc.nasa.gov>.

You also find quite a large selection of other Macintosh Ham software
at the DEMON FTP site.

Regards,

Sean.

I've never seen any AMSAT newsgroups, I can say with near certainty that there aren't any. However, there are several mailing lists, KEPS, SAREX, AMSAT-BB, send mail to listserv@amsat.org for more information.

>I havn't found the one you

I run a mailing list dedicated to distributing Shuttle Keps. To subscribe write to "listserv@alsys.com", include at the beginning of your message the command:

subscribe elements Your Full Name

To just get information about the list send the info command to the listserver:

info elements

1549. APT Equipment Suggestions??

Newsgroup: rec.radio.amateur.space
Date: 1994-09-28 22:20:10 UTC
From: smbourne@covina.lightside.com
Message-ID: <smbourne.26.001656B7@covina.lightside.com>
Source record: 26663

I'm thinking about buying some hardware to get NOAA/METOR APT
(and maybe GEOS/METEOSTAT) transmissions and I'm trying to decide on which
hardware is good.

I don't know anyone that is doing this, so I'm looking here.

I've gotten catologs from Vanguard, Quorum and OFS Weatherfax. Are there
others that I should know about? Any experience (good or bad) with any of
these? How about sources of used equipment.

Any suggestions or pointers will be greatlt appreciated!

Thanks,

Scott
Azusa, CA

Source record: 26802

In article <RG73AlI.wardf@delphi.com>, wardf@delphi.com writes:

Try the following, let me know if you find anything.....

ELEMENTS: Shuttle Keplerian Elements Mailing List

List Title: ELEMENTS: Shuttle Keplerian Elements Mailing List
List Owner or Contact: Gary Morris, elements-request@alsys.com

To subscribe to this list, send e-mail to LISTSERV@alsys.com; in the body of the message, type SUBSCRIBE ELEMENTS followed by your real name. For example: SUBSCRIBE ELEMENTS Jane Q. User.

To unsubscribe from this list, send the command UNSUBSCRIBE ELEMENTS in e-mail to LISTSERV@alsys.com.

Send all other list-related commands to LISTSERV@alsys.com. For assistance, send the command HELP.

This list is read-only; you are not permitted to post articles to the list.

This mailing list is "edited"; this means that one or more humans must approve all articles for publication. When you submit an article, it is reviewed by a human (or humans) who determine whether or not the article will be distributed to the list.

This mailing list is "moderated"; that means that one or more human beings monitors the flow of the list traffic and makes an effort to keep conversations topical. While virtually all lists have a set number of topics to which conversations should apply, moderated lists are more strict in their interpretations of the guidelines. To be a good member of a moderated list, do not go outside the topics of the list without first okaying it with the moderator(s).

This mailing list is echoed to the USENET newsgroups, sci.space.news, rec.radio.info, and rec.radio.amateur.space. You may find that participating in the list by reading it with the America Online USENET Newsgroups reader will be a more rewarding experience than participating over e-mail. To participate over USENET, use keyword NEWSGROUPS to go to the America Online USENET Newsgroups reader. Then click on the "Expert Add" button and supply the newsgroup name (sci.space.news, rec.radio.info, or rec.radio.amateur.space) when asked.

Keywords: space, aerospace, shuttle

Description:
The purpose of the mailing list is to get Shuttle elements out as quickly

as possible during shuttle flights. Only tracking data (elements) are sent to the list. There are no flight announcements, shuttle information or discussion on the list, since that information is available from several other sources. You will receive pre-launch predicted elements and post launch elements based on either Shuttle computer state vector data or on NORAD radar tracking data. The data is primarily Two-Line Element Sets, but also some AMSAT format element sets.

The list language is English.

1553. AEA DSP-1232 problem

Newsgroup: rec.radio.amateur.space
Date: 1994-09-29 02:04:07 UTC
From: rdhoughton@vms4.sci.csupomona.edu
Message-ID: <1994Sep28.190407.1@clstcs>
Source record: 26803

I would like to hear from anyone who has successfully made the STEP command work on an AEA DSP-2232 or DSP-1232 multi-mode controller. I have ver. 7.00 firmware dated December 1, 1993. AEA says this function works as of ver. 7.00 but I've had no luck.

Thanks in advance,

Bob KC6LVG

P.S. If you have tried and failed, I'd still like to hear from you.

There is a UK company called timestep. I have thier prosat2 board and
proscan receiver. Works really well. I'll post a pic on a.b.p.misc if you
like. Don't know if they sell in the US. Mail me if you want thier uk address.

1560. HELP - info about packet (satelite) Greenland - Europe (Internet)

Newsgroup: rec.radio.amateur.space
Date: 1994-09-29 20:49:36 UTC
From: m8827@abc.se
Message-ID: <CwwsIp.I94@abc.se>
Source record: 26666

Sorry about this flaky request, but my internetsource is using a editor
not compatible with the comm-lines (i.e. call UNIX - cu).

Have been sysadm for Greenland School of Commerce some years back,
a post a friend has today. He wants Internet (which he had in Denmark)
but at 3$/min it's a bit costly even with email for a small college in
the arctics. Is it possible to run a packet radio or cheap satellite
(amateur satellite) hookup to Internet today, and wat is needed to
do it. The place, Nuuk/Godthaab, is at aprox. 65 deg. north.

Greenland has it's own Internet domain, even if noone is using it today.

Please mail me your responces, since I not using this source to often,
but in the process of making a new gate with local netnews.

Laurent Ferracci (100407.436@compuserve.COM) wrote:
: RS 10 License.

: About the problem of transmitting on 10Meters through RS10:
: I am a no-code ham, and i wished to "test" some satellite communications before
: buying a better equipment. The easiest way was RS10.
: I also wondered if it was legal. I looked for an answer in many books.. No
: answer !!
: So i phoned the REF , and talked to them about my problem..
: The answer was (in fact): You don't have the right, but you can do it..

IF you were under the FCC's jurisdiction then whoever the REF is lied to you.
You have every "right" to use RS-10, as long as you adhere to the limitations
of your license class for transmissions leaving your antenna. If RS-10 chooses
to retransmit your signals, that is RS-10's control operator's problem, not
yours.

: This is a french point of view ! And that maybe explains why nobody deals with
: this problem in books.. So i made my QSO on RS10.. And heard some other
: no-code hams !

The reason it's not specifically addressed in books is because if you grasp
the concept of control op it's obviously OK. (Not trying to be mean, but
you've been lied to!!!)

Good luck, see you on the birds!!!

The manual is backwards on the up/down connector. Pins 1 and 4 are for Radio 2 while pins 3 and 5 are for Radio 1.

Hope this helps

I assume you mean re-transmitting NASA Television Audio ? If so, then you should
contact NASA TV (in Washington DC at NASA HQ). This is the best way as NASA TV wants to know about anyone utilizing their broadcasts (they are very interested as to who
and how many their audience is). I do not have their number offhand, but can find it
if you'd like it. I would encourage anyone who watches NASA TV to let them know
how much you appreciate them.

However, I caution that NASA TV audio may transmit things that are not permitted under
your FCC Amateur license. The Goddard Amateur Radio Club, Inc. retransmits NASCOM
audio which excludes such things as press conferences, which is the most likely (although unlikely)
to produce illegal transmissions. BTW, we are on HF at 3.860, 7.185, 14.295, 21.395 and on
occasion 28.650 MHz. Locally to the Washington DC area, we retransmit on 147.45 MHz
FM simplex.

We are presently testing our new dedicated facility as well as upgrading and rehabing our
antenna farm and would like signal reports.

SatTrak can directly read NASA 2-line element sets. Then you just need
to tell it to convert them to the longer format (one click of the mouse)
and save the new elset. Easy to do. SatTrak and MacSPOC are the two
programs I use all the time (SatTrak for predictive tables, MacSPOC
for real-time shuttle tracking).

1569. RE: Mac sat antenna-positioning program ?

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 12:02:18 UTC
From: pchien@ids.net
Message-ID: <36huil$8lu@paperboy.ids.net>
Source record: 26672

Check out Orbittrak. It's an excellent program which lets you
track dozen's of satellites at the same time (although the
screen does get to be a bit confusing when you do that) and
can be hooked up to a rotor through a controller (I forget
what model) hooked up to your serial port.

Oh yeah, it's shareware and at $20 an excellent buy.

1571. SETI Downloads...

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 14:15:33 UTC
From: MichaelMK@infoport.com
Message-ID: <7.47729205.InfoPort@infoport.com>
Source record: 26676

The message thread on my BBS system only goes back about five days; I'm wondering if I missed any replies to my enquiry whether data from the SETI (Search for Extraterrestrial Intelligence) Project is available on-line. If so, I'd like to know.

Thanks,
MichaelMK **********

1572. Is there a microsat FAQ?

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 16:15:47 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <36hdjj$8c9@newsstand.cit.cornell.edu>
Source record: 26677

Having some satellite experience under my belt, as well as some packet etc, I've finally gotten curious about using the microsats. Primary drive for it is a friend who is heading out on a boat trip with his Tech license and thinking how nice it would be to be able to exchange packet mail with him while he's in Fiji or wherever via a store and forward bird.

Last time I looked at them, I thought that there were too many different modems and stuff, and DSP units like the AEA and LLGrace units were just coming out so I elected to wait and see.

So what's it take? I've got a 736 and an old PK232 (pre MBX) I think I need a special modem and some special software, right? My friend has a dual band FM rig, and if I have it right I think we could probably use it as is for uplink and need to break out to a separate detector (such as his HF rig) to decode the downlink.

Do we run 1200 baud? 9600 baud? Where do you get the software, etc. Are several of the satellites running the same stuff, or are they all different? Are they very crowded?

Help and counsel appreciated.

1573. Two-Line Orbital Element Sets (TLE478)

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 18:56:19 UTC
From: tkelso@eel.afit.af.mil
Message-ID: <tkelso.780951369@afit.af.mil>
Source record: 26674

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

* DP3MIR ACTIVE ABOARD MIR SOON *
==================================
German Astronaut Dr. Ulf Merbold will be QRV aboard the space station MIR
signing DP3MIR during the ESA EUROMIR 94 mission starting 03-OCT-1994. In
order to give actual information regarding the mission to as many radio
amateurs and SWLs as possible, he will use the digital voice memory of
MIR's ham radio equipment designed and built by Thomas Kieselbach, DL2MDE.
Thomas made an arrangement with Ulf Merbold, DP3MIR, to load actual spoken
reports into the digital memory frequently, as time permits however,
probably every 2-3 days. The reports in English and German will then be
retransmitted automatically during the consecutive orbits on 145.550 MHz
FM in regular time intervals. Ulf Merbold will stay aboard MIR for 30 days.

[Info via Norbert, DF5DP, DARC Coordinator Satellites an Space Projects]

* INTERNATIONAL SYMPOSIUM *
==========
The SpaceOps '94 International Symposium sponsored by the NASA/Goddard Space Flight Center (GSFC) will be held on November 15-18, 1994 at the Greenbelt Marriott Hotel in Greenbelt, Maryland.

The theme for the SpaceOps '94 is opportunities in ground data systems for high efficiency operations of space missions. Of special interest are techniques leading to improved system productivity, effectiveness, and efficiency; trade-offs between mission requirements and end-to-end system architectures; and new technologies and techniques for systems suited to future space missions.

The SpaceOps '94 will serve as a vehicle for communicating results and plans concerning present and future operations of space missions and ground systems. It generally attracts 400 specialists from many countries who take this opportunity to share their experience and knowledge with others engaged in similar activities.

For more information, please contact:
Laura Capella, Conference Coordinator
Jorge Scientific Corporation
Suite 1130
7500 Greenway Center Drive
Greenbelt, MD 20771
Voice: 301-220-1701 Fax: 301-220-1704
E-mail: spaceops@kong.gsfc.nasa.gov

* AO-21 NEWS *
==========
Satellite controllers recently noticed a significant event on AO-21. There have been 51 multi-bit errors in the RAMDISK where the actual WEFAX test image is stored. In addition, temporary bit errors in the EPROM that is used for testing purposes were found in the RAMDISK as well. At about the same time, operations at the host spacecraft resulted in a temperature increase of about 6 degrees C. Fortunately the program running in the RTX computer had been continuing to operate smoothly. Users could only notice that the FAX picture had been automatically replaced by telemetry in the schedule.

In order to find out what really happened, controllers are looking for copies of the AFSK Packet Telemetry of RUDAK II transmitted from 15-Sep-94 to 18-Sep-94. Copies should be sent:

- via PACKET to Robert: DD4YR @DB0AAB.#BAY.DEU.EU
- or via INTERNET to Peter : db2os@amsat.org

1575. Is there a microsat FAQ?

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 19:03:15 UTC
From: rparsons@tcet.unt.edu
Message-ID: <36hndj$r6a@hermes.unt.edu>
Source record: 26671

You asked a lot of questions, but I'll try. As far as stroe-and-forward sats, in general there are the 1200 bps ones and 9600 bps ones. Other than having to make minor mods to your rig, the 9600 ones are easiest to use and much faster also. UO-22, KO-23 and KO-25 are the current ones. You will need a 9600 bps modem, TAPR has a kit, but you need a modem disconnect header, which the 232 doesn't have I believe. I think TAPR also as a header add-on kit also. TAPR/AMSAT also now has a DSP modem kit DSP-93. Contact AMSAT for software (you should be a member if you use the sats.

Ask more specific question and I'll try to answer.

Ron W5RKN

1576. Re: Packet Radio (SAREX)!!!

Newsgroup: rec.radio.amateur.space
Date: 1994-09-30 19:21:21 UTC
From: pchien@ids.net
Message-ID: <36io9u$bas@paperboy.ids.net>
Source record: 26679

Blatant plug for myself follows -

The September/October issue of the Amsat Journal had a detailed article explaining why the STS-64 mission was power limited and SAREX would probably be restricted to voice only ops. Amsat members do get a bit more informations than the average ham. If you're interested in SAREX it doesn't hurt to follow the journals put out by the experiment's sponsors - especially when they're amateur radio organizations.

Modesty prevents me from telling you who wrote that article.

Also - all of the 'official' NASA information and SAREX bulletins stated that this mission would operate SAREX in the -B (voice only) mode of operations. The only way SAREX was approved for STS-64 was with the agreement that it wouldn't require any orbiter power (e.g. full operations on batteries - a/k/a voice only operations) -- even though the entire -C hardware (voice and packet) was carried on the chance that there would be enough power to operate packet later in the mission.

The late October (e.g. October 34 a/k/a/ November 3rd) STS-66 mission will not include SAREX. Ellen Ochoa will become the first person who holds a valid amateur radio license to fly aboard the shuttle without having the SAREX hardware onboard. *sigh* SAREX cannot fly on every mission no matter how much many of us would want it to. Most importantly the ground team couldn't handle that many missions without interfering with their actual jobs and other responsibilities. (You know - the ones which pay the mortgage and keep the boss happy who gives you permission to do SAREX activities in your spare time). Also there are many complicated missions with very intensive crew timelines where there just isn't enough time in the crew's schedule to justify SAREX's inclusions.

I have no special access to the astronaut's schedules or frequencies, but I do try to make my own contacts and tried many times during STS-64. (Well I'll admit that I tried to get Dick Richards KB5SIW to promise that he wouldn't take the shuttle home until he heard my call sign - but that's besides the point).

On my first good pass I heard Dick Richards doing random QSOs before he was to make a school contact - and heard him talking to a mutual friend in Houston. On the next pass Jerry Linenger was doing a school contact so there wasn't time for general QSOs. (BTW - that school pass set a new record for the number of questions answered by an astronaut - over 20!). Not surprisingly nobody was on the

radio during the rendezvous with the Spartan spacecraft or during
the EVA Spacewalk. But at least I tried, and will continue to try
in the future.

BTW - during the crew's postflight presentation they commented that
everybody wanted to talk with Susan Helms, even though she didn't
have a call sign. (She used Dick Richards as a control operator and
his call sign). They kidded about all of her boyfriends, and she
commented that she got to talk to 40-50 people. Carl meade also
tried random QSOs.

Overall the mission was incredibly successful, including SAREX. All
of SAREX's primary objectives (school contacts) were sucessfully
completed, and many random QSO passes were performed. If you didn't get
through - try again.

Philip Chien KC4YER
no sig yet

P.S. - next planned SAREX mission is STS-67 with the ASTRO-2 payload
scheduled for late February. The most enthusiastic ham on that
crew is certainly Dr. Ron Parise WA4SIR. Several other crewmembers
are also getting/have their licenses.

Source record: 26678

>I'm thinking about buying some hardware to get NOe, with no success.
ETEOSTAT) transmissions and I'm trying to decide on which
>hardware is good.

Try MultiFax. They use assembler code for the graphics drivers, and
store ALL of the APT signal. As you zoom in you pull up more and more
resolution of data not seen before. Other packages tend to store the APT
in memory, so a zoom only gets you a larger view of the same data.
MultiFax is also fairly inexpensive. To get the best picture they allow
you to record the birds signal as it passes, and play it back into
MultiFax later-this way the computer noise doe not effect you APT
download. This may make a difference here. My GateWay effects my ICOM
reception-even with after adjusting the bandwidth and notch filters.
Also, read Taggarts Satellite Handbook for more info.

1579. Will an ICOM R7100 Work for APT/AVHRR Reception

Newsgroup: rec.radio.amateur.space
Date: 1994-10-01 15:52:39 UTC
From: Ken Terry <ken_terry@macmail.eng.gulfaero.com>
Message-ID: <36k0k7INNk5c@gulfaero.com>
Source record: 26688

I have used an ICOM R9000 with success downloading APT/AVHRR signals, however I have a friend that wants to get into this a 'little' cheaper. Has anyone had any success getting APT/AVHRR downloads with success from an ICOM R7100. If so, did any adjustments have to be made to the bandwidth. I am not familiar with this unit, and do not know if there is an adjustment for this on the front control panel. I have info coming from ICOM, however I would rather hear from the real users of this equiptment.

Thanks in advance!

Ken

Sounds like I'll need a new tnc, a new modem, and some expensive software. I've been an amsat member when I was more active, but I think I'm lapsed now. I was hoping to be able to do it as an incremental step up on the current station. The dsp modems still sound like the best way to deal with the changing states of digital communications, but it doesn't seem that they are very stable yet either.

Still, it would be a good way to keep in touch with the boat. How busy are the satellites?

Kevin

1582. Is there a microsat FAQ?

Newsgroup: rec.radio.amateur.space
Date: 1994-10-01 17:20:20 UTC
From: rparsons@tcet.unt.edu
Message-ID: <36k5ok$l7l@hermes.unt.edu>
Source record: 26693

>Sounds like I'll need a new tnc, a new modem, and some expensive
>software.

Perhaps I didn't make myself clear. Your TNC (with mods) should be ok.
You will need a modem appropriate to the sat. The software is not expensive.
Most is available only for DOS (i'd suggest PB/PG/SatSked) or Windows
(I'd suggest WiSP) all available very cheaply from AMSAT.

If you will be going in for more than a single mode, then the DSP route
makes sense. The available DSP modems are VERY stable. Recommend AEA
DSP-2232 (good support), DSP-12 (support seems absent but the unit works
well), and soon to be available from TAPR -- DSP-93 kit.

The 9600 bps sats are very busy, but there's always room for one more.

Best spot I've found so far is :

FTP to archive.afit.af.mil:/pub/space/....(anonymous login etc)

The files in here are updated daily by Dr Thomas Kelso at about 21h00-23h00.
I am not sure if this is EST or UTC time, maybe someone can tell me!!

There are about 12 files in this directory (/pub/space) with the extn of .tle
The most popular I should think are amateur.tle, weather.tle, sts.tle and
mir.tle.

Hope this is useful.

Hello!

I've got AmiSat by DG7YFQ which displays Satellites on a world map,
calculates antenna postitions and so on.
It works fine on any Amiga, I've tested it on an A 500 and on my
A 1200...

Near Outer Space Transportation System (NOSTS-1)
Balloon Launch - Clear Lake Amateur Radio Club
Sunday - October 9, 1994

Near Outer Space Transportation System utilizing a 12 foot diameter helium balloon as the launch vehicle. NOSTS-1 is an amateur radio experiment which will carry a various payloads in a package weighing less than 6 pounds. All interested hams are invited to participate.

The payload consists of:

* 2 meter packet on 145.75 MHz simplex - the node name for digipeating is NOSTS-1, the mailbox callsign is KJ5MX-6, the beacon IDs as KJ5MX-3.

* 10 meter voice beacon on 28.322 MHz Double Side-Band with an ID interval of 33 seconds

* Beacon on 29.420 MHz sending "CW" beeps that correspond directly to the outside temperature. At 70 degrees Fahrenheit the beep rate is approximately 200/min. To calculate temperature from beep rate the formula: Temp(degrees F) = [0.56853 X (Beep rate)] - 38
The antenna for this device is a 2 meter dipole cut to enhance the 5th harmonic at 147.10 MHz for direction finding purposes.

* Beacon on 224.72 MHz for direction finding purposes only.

* Potential secondary payloads may include a 10 GHz gigaplexer beacon and a 2 meter uplink (147.435 MHz), 70 cm downlink (440.95 MHz) FM repeater. Final announcements on these payloads will be made on launch day.

The Clear Lake Amateur Radio Club Balloon Launch Team wishes to thank Andy MacAllister, WA5ZIB and members of the South Texas Balloon Launch Team for assistance, advice, and use of 220 MHz beacon, 29.420 MHz fireball transmitter for this launch.

An informal simultaneous HF (7.155 Mhz or up for QRM) and UHF (442.750 SE Houston | 444.275 MHz NW Houston repeaters) net will be held at 7PM on Saturday October 8th for final updates. The 40 meter net on the same frequency will be active immediately before and during the flight.

The lauch site will be west of the Houston area and the direction of flight will be from west to east. Coverage may extend several states on some modes. Reception reports including frequency, time, and YOUR location are encouraged.

For additional information and reception reports contact:

Hi! Just curious...where can I get info on GPS? I'm wondering what kind of GPS receiver I should get.

TIA

SB SAT @ AMSAT $ANS-274.01
IARU APPOINTS SATELLITE ADVISOR

HR AMSAT NEWS SERVICE BULLETIN 274.01 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-274.01

IARU Appoints Satellite Adviser

In a news release dated 26-SEP-94, the International Amateur Radio Union (IARU) announced that it has appointed Hans van de Groenendaal (ZS5AKV) to the newly created post of IARU Satellite Adviser. According to the IARU release, the principle task of this position will be to keep the IARU Administrative Council informed on all technical and operational aspects of the Amateur Radio Satellite Service in order to enable the Council to adopt appropriate policies to advance the interest of the Amateur Satellite Service before the International Telecommunication Union (ITU) and regional telecommunications agencies.

The IARU release noted that ZS5AKV, as past President of Southern African AMSAT and an Executive Committee member of IARU Region 1, brings many years of satellite related experience to this appointment. The IARU release further noted that the appointment is a direct result of recommendations made to the IARU Administrative Council by the IARU Ad Hoc Satellite Advisory Committee which took up the interim report at the recently completed IARU Administrative Committee meeting in Singapore. The IARU release commented that this action is "tangible proof" of IARU's interest and involvement in the Amateur Satellite Service.

The release continued by citing IARU's many year role in protecting the Amateur Satellite Service, in particular its work during the 1979 World Administrative Radio Conference which led to most of the present Amateur Satellite Service frequency allocations.

The IARU release also stated that the "exponential development of new technologies and ever increasing complexity of the Regulatory Agencies, the IARU Administrative Council deemed it necessary to involve itself closer with the Amateur Satellite Service in order to represent it effectively on a coordinated world-wide basis while cementing its relationship with the AMSAT and other Amateur Radio Satellite groups."

In the release the IARU said that in his new capacity and by the powers delegated to him by the IARU, ZS5AKV will have the task of appointing someone to the post of IARU Satellite Frequency Coordinator.

The IARU said that ZS5AKV is now soliciting nominations for volunteers willing to serve the function of IARU Satellite Frequency Coordinator. Such nominations should be sent to him by FAX at +27-31-765-6456 or via INTERNET at amsat@uctvax.uct.ac.za before 31-OCT-94. Hans said that each nomination should include a comprehensive summary of the nominee's background and qualifications. He stated that it is his intention to discuss the various nominations with major AMSAT groups in order to seek their recommendations. He underscored the importance of finding the right person to be appointed to this very important job.

SB SAT @ AMSAT $ANS-274.02
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 274.02 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 1, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-274.02

Weekly OSCAR Status Reports: 01-OCT-94

AO-13: Current Transponder Operating Schedule:
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Blon/Blat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

FO-20: FO-20 has been switched back into the analog mode as of 14:30 UTC 28-SEP-94. The command station announced that "mailbox software ran away" and there is a malfunction known as UVC (Under Voltage Control) has been confirmed by command station. FO-20 will be staying in its analog mode until 10-OCT-94. [JJ1WTK]

MIR: German Astronaut Dr. Ulf Merbold will be QRV aboard the space station MIR signing DP3MIR during the ESA EUROMIR 94 mission starting 03-OCT-1994. In order to give actual information regarding the mission to as many radio amateurs and SWLs as possible, he will use the digital voice memory of MIR's HAM RADIO rig designed and built by Thomas Kieselbach (DL2MDE). Thomas made an arrangement with Ulf Merbold, DP3MIR, to load actual spoken reports into the digital memory frequently, as time permits however, probably every 2-3 days. The reports in English and German will then be retransmitted auto-matically during the consecutive orbits at 145.550 Mhz (FM) in regular time

intervals. Ulf Merbold will stay aboard MIR for 30 days. [DF5DP]

RS-10: WA6ARA reports that RS-10 is operating well with a good mix of SSB and CW. Orbit times are great for late evenings to the East and with early evening passes to the West. [WA6ARA]

RS-12: WA6ARA reports that Mode-K is alive and very well. RS-12 is just starting to appear in late evenings. Over the next month the passes will be great for evening passes. [WA6ARA]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Source record: 26697

Although I don't think we have the equipment to recieve shuttle
conversations with hams, we'd like to try.

What frequencies do the shuttle missions use for talking to hams ?

Do they use any modes other than FM and packet ? Do they use an offset
between transmit/recieve or is it strictly simplex ?

Also, the last Keplerian data I had for the shuttle was from PRE-launch.
Does anybody have newer data or know where I can find it ?

Thanks,
Reddy

ARLS032 Listen for Mir beacon

German astronaut Dr. Ulf Merbold will be active aboard the space station MIR, signing DP3MIR, during the European Space Agency's EUROMIR 94 mission, scheduled to begin October 3.

Dr Merbold will give ''information regarding the mission'' using a digital voice memory designed and built by Thomas Kieselbach, DL2MDE. Kieselbach has arranged with Dr Merbold to load actual spoken reports into the digital memory as frequently as time permits, probably every two to three days, according to Norbert Notthoff, DF5DP, the Deutscher Amateur Radio Club's Coordinator for Satellites and Space Projects.

The reports in English and German will be retransmitted automatically on 145.550 MHz FM.

Dr Merbold will stay aboard MIR for 30 days.

I get lots of inquiries about the mailing list. Attached is a copy of the latest (just revised today) help/info file for the Shuttle Elements Mailing List. Note that the mailing list moved to a listserver in July and everyone on the old list had to resubscribe, if you didn't, that is why you aren't getting anything.
--GaryM

----------<cut here>----------<cut here>----------<cut here>----------

Shuttle Elements Mailing List
Information File

Table of Contents (941003)

(1) July 94 List Changes
(2) Purpose of the Shuttle Elements Mailing List
(3) How to subscribe and unsubscribe
(4) How to access the elements archives
(5) In case of problems.

(1) July 94 List Changes

In July 1994 the Elements Mailing List changed from a manually operated mailing list to a listserv list, subscribers on the old list were all sent a notice about the change. The old archive server is also gone, since the new listserv software also has file archive and retrieval commands. You can now subscribe, unsubscribe, change your mailing address, and access the archive all by sending requests to an automated listserver, at the "listserv@alsys.com" address. The elements-request address is no longer used to subscribe/unsubscribe to the list.

(2) Purpose of the Shuttle Elements Mailing List

The purpose of this list is to get Space Shuttle Keplerian elements out as quickly as possible during shuttle flights. Subscribers will receive pre-launch predicted elements, rotated pre-launch elements right after launch (to compensate for launch delays), and post launch elements based on either Shuttle computer state vector data or on NORAD radar tracking data. Basically you will be getting the most up to date data I and several others can put together.

The data sent to the list will be primarily Two-Line Element Sets, but also some AMSAT format element sets, and sometimes both. If you want information about the Two-Line Element Set format, Dr TS Kelso posts a format description article to USENET newsgroups rec.radio.amateur.misc and sci.space. If you don't have access to USENET you can get a copy from the email elements archive server.

All elements sets are sent to all list subscribers as soon as they are released. If you want to get the most recent Shuttle element set sent to the list, you can retrieve it from the elements archive maintained by the listserver. Send email to the listserv address, "listserv@alsys.com", with the text of the mail containing the following command:

get elements last-shuttle-elset

For more information on the archive server, you can send the command "help" to the listserv address. The listserver has elements for many previous Shuttles and general information regarding element data.

This list is a moderated list for data distribution only, it is not a discussion list. Submissions to the list are by prior arrangement only.

Please unsubscribe from the list if you email account will be closing or update your address if it is going to change (send "help set" for more information). If we receive unknown host or user mailer error messages from your account your subscription is subject to termination without notice.

(3) How to subscribe and unsubscribe

To subscribe to the Shuttle Elements Mailing List you send a command in an email message to "listserv@alsys.com". The command must be the first line of text in your email message and there must be nothing in the text portion of your message preceding the command. To subscribe the command is like this, except you use your name instead of John Smith:

subscribe elements John Smith

The command should be the first line of text in your mail message, nothing may precede the command (except of course the mail headers). You will get a confirmation back in the email with your password. Your password will be used in the future should you want to change your address or unsubscribe to the mailing list.

To unsubscribe from the elements list, send the following command:

unsubscribe elements

To change your email address after you have subscribed, send the following command:

set elements address <password> <new-address>

(4) How to access the elements archives

If you are interested in accessing files in the archives, you can send a message containing the word "help" to get the complete set of instructions.

The following index commands will tell you what files are available.

index elements
index elements/data
index elements/info

The most commonly used command on the listserver is:

get elements last-shuttle-elset

(5) In case of problems.

First, get the help file, send the command "help" to listserv@alsys.com,
or if you have problems with a set command, send the command "help set"
to the listserv.

If you get a message back that says your command was unrecognized, make
sure the you or your mail system is not putting headers or markers in the
beginning of the text part of your message. Some mailers put ----------
in the beginning of the text, if yours does this you need to disable that
"feature".

In you have problems with the listserv that you can't solve after reading
the help files, you may write to me at garym@alsys.com or call me at my
number below. If you call outside normal office hours, you can leave a
message on my voice mail. If you need a reply back be sure to give your
Internet address (spell it out if it's not clear) so I can reply by email,
I do not return long distance phone calls, nor do I have time for phone tag.
In any case, email is preferrred, you will get a quicker response that way.

In article <genefCx1ssC.1Bo@netcom.com>, genef@netcom.com (Gene Fornario) writes:

Trimble Navigation in Sunnyvale makes some very nice GPS units. They make many different models for many different uses. Some will hook up to a serial port other for backpacking etc. I own a Sony and my only complaint is the batteries are consumed very quickly. Also, how hard would it have been to add a serial port? Another function that would have been nice is one that would turn the GPS unit on at an adjustable increment to recieve position, then turn of again.
Any GPS unit should have functions including waypoints,speed,altitude,direction of travel, direction to waypoints,and of course lat,lon. My Sony will give you a graphic display of the path you traveled.

Hope some of this helps!
Walt Dunckel (KD6VYV)

1605. Two-Line Orbital Element Set: Space Shuttle

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1606. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-10-04 17:26:54 UTC
From: tkelso@dolphin.afit.af.mil
Message-ID: <tkelso.781291605@afit.af.mil>
Source record: 26713

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]

1607. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-10-04 18:09:33 UTC
From: tkelso@dolphin.afit.af.mil
Message-ID: <tkelso.781294163@afit.af.mil>
Source record: 26714

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1608. Satellite Tracking for Windoze

Newsgroup: rec.radio.amateur.space
Date: 1994-10-04 19:24:40 UTC
From: ae517@FreeNet.Carleton.CA
Message-ID: <Cx5xx5.6wI@freenet.carleton.ca>
Source record: 26709

Hope this isn't already in a FAQ, but what shareware is available to try
for satellite tracking in the Windows world, and where could one FTP it?

any hints would be appreciated.

<anaylor@delphi.com> writes:

Hi Andrew,

>What are the sats that I can work with just standard AX.25 1200 baud
>packet?

That I'm aware of the only 1200 baud FSK bird is presently the Russian
space station MIR. If you're interested, you can copy telemetry from DOVE
(DO-17). FO-20 is not a pacsat type, but it uses 1200 baud PSK (I
believe!).

>what are the requirements for running the pacsats?

Since you're already working the birds on voice, you've got the hard part
licked. The question you have to ask is: do to you want to work the 1200
baud PSK birds or the 9600 birds? Either way it's going to be an extra
expenditure. If you have a TNC that can accept another modem via an
alternate header then you only have to buy the modem and not a whole
TNC. Also, if you want to work the 9600 baud birds you have to have a
radio
that transmits true FM as opposed to phase modulation, such as the
FT-736 or TS-790A, and you have to be willing to make the modification
to connect directly to the discriminator and varactor. Lastly, you need
software for the pacsat protocol suite. Presently there are two versions
out there: PB and PG are a text-based system for downloading and upload-
ing to the birds respectively; WiSP is a Windoze-based set of applications
that is 'way-cool' and is pretty much what everybody is moving to.
Well, I hope that answers your questions. I'd be happy to answer any
further
ones you have. Hope to see you on the digital birds soon!

73's & CUL de N4SMY, - Ken -

WiSP is aMicrosat groundstation program for Windows. It also has some reasonably basic tracking functions. It is available on ftp.ucsd.edu in the hamradio/incoming directory. Most files are located in the file WISPxxxx.zip (xxxx being the date and I can't remember it). I uploaded a new GSC today and it is in the file GSC083E.ZIP.

EZSATS off Packet due to Lightning Hit
BID$ EZINF000

Our only local packet BBS, WD9ESU.WI.USA.NOAM, took a direct lightning hit on Sept 25 and his entire station, including the computers, radios, TNCs and antennas, was reduced to charred rubble.

N9KAN was posting the EZSAT satellite pass times for me via WD9ESU and that is no longer possible. Since quite a few people use these bulletins, I'm going to post them to this newsgroup and ask that someone upload them to packet for me. I've put BID numbers in the bulletins for the first time so duplicates can be deleted by packet sysops.

I'll return to sending them via packet as soon as we get re-connected to the outside world, but right now south central Wisconsin is in a black hole, as far as nationwide packet access is concerned. Boy, you never know what you've got until it's gone!

Please post this message too so that people who have been wondering what happened to the bulletins know what's going on.

Thanks and 73,
Dave, N9LTD
formerly at WD9ESU.WI.USA.NOAM

* Polar orbits: lower case letters mean the pass is to east, upper to west
Maximum altitude above horizon: a=81-90 b=71-80 c=61-70 d=51-60 e=41-50
f=31-40 g=21-30 h=11-20 i=01-10 degrees

These satellites can be received with 2-meter or HF rigs. All times are
for the start of the pass. An average pass is 10-15 minutes long. For late
breaking news, listen to the EZSATS feature on `This Week in Amateur Radio',
Saturdays at 6:30 PM CDT on Galaxy 3, transponder 17, 5.8 MHz audio. Please
ask your local repeater owners to carry TWAR. For more info:

* Polar orbits: lower case letters mean the pass is to east, upper to west
Maximum altitude above horizon: a=81-90 b=71-80 c=61-70 d=51-60 e=41-50
f=31-40 g=21-30 h=11-20 i=01-10 degrees

These satellites can be received with 2-meter or HF rigs. All times are
for the start of the pass. An average pass is 10-15 minutes long. For late
breaking news, listen to the EZSATS feature on `This Week in Amateur Radio',
Saturdays at 6:30 PM CDT on Galaxy 3, transponder 17, 5.8 MHz audio. Please
ask your local repeater owners to carry TWAR. For more info:

1623. EZSATS - Eastern Passes 10/03-11/01

Newsgroup: rec.radio.amateur.space
Date: 1994-10-05 09:06:53 UTC
From: dt650@cleveland.Freenet.Edu
Message-ID: <36tqbd$lvk@usenet.INS.CWRU.Edu>
Source record: 26725

Please don't post these to packet - they contain four weeks worth of pass
times for the Eastern half of the country and are too long for packet.

1624. EZSATS Western Pass Times 10/03-11/01

Newsgroup: rec.radio.amateur.space
Date: 1994-10-05 09:30:51 UTC
From: dt650@cleveland.Freenet.Edu
Message-ID: <36trob$mat@usenet.INS.CWRU.Edu>
Source record: 26726

Please don't post this file to packet. It contains four weeks worth of
pass times for the Western half of the US and it's too long for packet.

Easy Sats West - Western US Satellite UTC Pass Times de N9LTD

1625. Re: AEA DSP-1232 problem

Newsgroup: rec.radio.amateur.space
Date: 1994-10-05 16:18:56 UTC
From: n4hy@tang.ccr-p.ida.org
Message-ID: <N4HY.94Oct5161856@tang.ccr-p.ida.org>
Source record: 26729

It depends on what your radio is as to how it functions. What type of
radio are you using?

Bob

1626. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-10-05 20:58:36 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.781390716@dolphin>
Source record: 26732

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1628. SATTRACK V2.0 FOR UNIX/LINUX AVAILABLE NOW

Newsgroup: rec.radio.amateur.space
Date: 1994-10-06 03:33:17 UTC
From: manfred@sunspot.ssl.berkeley.edu
Message-ID: <36vr5t$ds5@agate.berkeley.edu>
Source record: 26731
Cross-posted to: sci.space.shuttle,rec.radio.amateur.space,sci.geo.satellite-nav,rec.video.satellite.tvro

SatTrack V2.0 Release

Finally version 2.0 of SatTrack is ready to be released. This new version features the NOARD SGP4 propagation model, a live display for a single satellite as well as a live display for multiple satellites (as many as the computing power of the machine it runs on allows), a batch mode with arguments passed on the command line, and the orbit prediction capabilities that V1.7 had. Numerous suggestions from users of V1.7 all over the world have been incorporated in the new version, like tracking of the Sun and the Moon for system tests and EME, respectively, the calculation of off-pointing (squint) angles, and also some subroutines that allow control of ground station equipment (radios and antenna controllers). The framework for the latter is provided in a way that allows the user to easily make changes for a particular application. The program will run on Sun workstations and Linux i386 laptop computers (see documentaion file).

Future releases are expected to feature the SDP4 model for satellites with a period of more than 225 minutes (V2.1) and Xwindows graphics (V3.0).

Bob Kupiec was kind enough to provide an FTP site from which SatTrack can be obtained. Do the following:

ftp ftp.jvnc.net (128.121.50.2)
login anonymous
cd /priv/kupiec/incoming (or later: cd /priv/kupiec/sattrack)
get sattrack.V2.0.tar.Z

Place this file into your Unix home directory, uncompress it, and then type 'tar xvpf sattrack.V2.0.tar'. This will unbundle the distribution file and will create all necessary sub-directories. Then look into the documentation file 'sattrack.doc' in SatTrack/doc for instructions how to compile sattrack (and some other auxiliary programs). It should compile perfectly on at least Sun-3's (SunOS 4.0.3), SPARCstation IPCs (SunOS 4.1.1) and i386 laptops running Linux. Make sure the compiler and linker flags in the Makefile are configured properly!

Please let me know how the installation went and if you encountered any problems, bugs or imperfections.

1629. SATTRACK V2.0 CORRECTION

Newsgroup: rec.radio.amateur.space
Date: 1994-10-06 05:46:32 UTC
From: manfred@sunspot.ssl.berkeley.edu
Message-ID: <3702vo$gua@agate.berkeley.edu>
Source record: 26733
Cross-posted to: sci.space.shuttle,rec.radio.amateur.space,sci.geo.satellite-nav,rec.video.satellite.tvro

SatTrack V2.0 Release Correction

Oops, I forgot to set the mode to binary when transferring the compressed
distribution file to ftp.jvnc.net. Since I can't wipe out the corrupted
file, I posted another one with a slightly different name (see below).
To get this one, do:

ftp ftp.jvnc.net (128.121.50.2)
login anonymous
binary
cd /priv/kupiec/incoming (or later: cd /priv/kupiec/sattrack)
get sattrack.V2.0.tar.dist.Z

Place this file into your Unix home directory, uncompress it, and then
type 'tar xvpf sattrack.V2.0.tar.dist'. This will unbundle the distribution
file and will create all necessary sub-directories. Then look into the
documentation file 'sattrack.doc' in SatTrack/doc for instructions how to
compile sattrack (and some other auxiliary programs).

Sorry for the inconvenience. My fault.

Manfred Bester

1630. Phase schedules

Howdy! I was womdering if any of you know where I can find updates of
the phase schedule for varies satellites. Example: AO-13 Phase 1-180:mode B
Phase 180-256:mode J

That was the last update I have as of 20APR94, I'd like to get something
more recent. Thanks!

Sattrack has moved to its new home in the sattrack directory. The
following commmands should get you a copy.

ftp ftp.jvnc.net (128.121.50.2)
login anonymous
binary
cd /priv/kupiec/sattrack
get sattrack.V2.0.tar.Z

1636. RE: Tracking models ?

Newsgroup: rec.radio.amateur.space
Date: 1994-10-06 22:50:34 UTC
From: srghsjm@grv.grace.cri.nz
Message-ID: <371vjs$r5k@zephyr.grace.cri.nz>
Source record: 26739

In Article <1994Oct6.065111.1@violet.ccit.arizona.edu>
dpalik@violet.ccit.arizona.edu writes:
>What is the difference between the Tracking models (SGP4 propagation model, and
>the others) ??

For various reasons (including computational simplicity) the complicated
models that were historically developed have been simplified and refined
to models such as SGP4. By doing so, some new parameters have had to be
added to the basic element sets. The other most common prediction model
around seems to be the TBUS predictor that uses (as expected) some TBUS
elements.

>
>Is one more accurate ?
>

That's actually a more difficult question to answer than it seems. The
accuracy can be required for either short term or long term periods.
For all practical purposes, with the range of element sets that are
available over Internet, all models are pretty good (or, equally bad,
depending on your point of view).

>Do they all require the same data from TLE sets ?
>

No. The SGP4 predictor uses NASA 2-line elements that are designed
for SGP4. The NASA 2-line element format allows for SGP8, but I don't
think that was used (correct me if I'm wrong). SGP8 requires some
extra parameters. The TBUS predictor (used often in earth resources
satellites and for many low earth orbit ground stations) uses parameters
from TBUS element sets. Don't use TBUS elements in the SGP4 model, or
the reverse.

The W3IWI predictor model (a la "Orbit" circa 1986 or something like that)
is simplified model that, while cutting a few corners, takes a fairly
practical line in doing so.

Source code for SGP4 and TBUS predictors is available (albeit in FORTRAN),
but various people have converted these to Pascal and C. The results
are variously readable code...

Balloon Launch - Clear Lake Amateur Radio Club
Sunday - October 9, 1994

***** UPDATE ***** 10/7/94
Balloon launch scheduled for launch window from 10am to 12noon Sun 10/9
from Wharton Airport, Wharton Texas
****

Near Outer Space Transportation System utilizing a 12 foot diameter
helium balloon as the launch vehicle. NOSTS-1 is an amateur radio
experiment which will carry a various payloads in a package weighing
less than 6 pounds. All interested hams are invited to participate.

The payload consists of:

* 2 meter packet on 145.75 MHz simplex - the node name for digipeating is
NOSTS-1, the mailbox callsign is KJ5MX-6, the beacon IDs as KJ5MX-3.

* 10 meter voice beacon on 28.322 MHz Double Side-Band with an ID interval
of 33 seconds

* Beacon on 29.420 MHz sending "CW" beeps that correspond directly to the
outside temperature. At 70 degrees Fahrenheit the beep rate is
approximately 200/min. To calculate temperature from beep rate the
formula: Temp(degrees F) = [0.56853 X (Beep rate)] - 38
The antenna for this device is a 2 meter dipole cut to enhance the 5th
harmonic at 147.10 MHz for direction finding purposes.

* Beacon on 224.72 MHz for direction finding purposes only.

* Potential secondary payloads may include a 10 GHz gigaplexer beacon and
a 2 meter uplink (147.435 MHz), 70 cm downlink (440.95 MHz) FM repeater.
Final announcements on these payloads will be made on launch day.

The Clear Lake Amateur Radio Club Balloon Launch Team wishes to thank
Andy MacAllister, WA5ZIB and members of the South Texas Balloon Launch
Team for assistance, advice, and use of 220 MHz beacon, 29.420 MHz fireball
transmitter for this launch.

An informal simultaneous HF (7.155 Mhz or up for QRM) and UHF (442.750 SE
Houston | 444.275 MHz NW Houston repeaters) net will be held at 7PM on
Saturday October 8th for final updates. The 40 meter net on the same
frequency will be active immediately before and during the flight.

The lauch site will be west of the Houston area and the direction of
flight will be from west to east. Coverage may extend several states
on some modes. Reception reports including frequency, time, and

YOUR location are encouraged.

For additional information and reception reports contact:

1648. Two-Line Orbital Element Sets (TLE483)

Newsgroup: rec.radio.amateur.space
Date: 1994-10-07 21:49:56 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.781566596@dolphin>
Source record: 26757

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1649. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-10-07 21:52:13 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.781566733@dolphin>
Source record: 26756

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Radio Meteor Observation Bulletin No. 14 October 1994

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: M. De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.17 MHz
Transmitter Locations:
Katowice, PR3, Poland, 65.99 MHz, 14 kW, Distance 1100 km
P. Neant, PR3, Romania, 66.17 MHz, 40 kW, Distance 1400 km
Czestochowa, PR3, Poland, 66.23 MHz, 20 kW, Distance 1080 km
Gdansk, PR3, Poland, 66.29 MHz, 40 kW, Distance 1100 km

Antenna: crossed Yagi, 4 elements, Azimuth 270 o (=East), elevation 30 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava
Sensitivity: 8 muV for S/N = 26 dB (300 Ohm)
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored on file
in the University of Ghent format (Prometeos), and are available for
further analysis. Reduction software for DOS and Windows available].

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Sep |
```

Notes:

. % : transmitter outage during the whole hour or a part of it. Low counts indicate that no other interference, which could be confused with meteors, is picked up.
Few transmitters are broadcasting between 2h-4h local time (Sat-Sun 3h-5h local time) or sometimes longer. (When winter hour is in use: local time = UT + 1h).
The switch to winter hour took place during the night of Sept 24-25.

. & : manually eliminated for direct reception.

M. De Meyere / C. Steyaert

Observer: Roger Stapleton
Location: St. Andrews, Scotland (2 50' W, 56 20' N)
Frequency: 70.31 MHz
Transmitter Locations:
Gdansk, Poland, 70.31 MHz, 40 kW
Opole, Poland, 70.31 MHz, 60 kW
Plzen, Czech Rep, 70.34 MHz, 30 kW

Antenna: horizontal dipole, Azimuth 65 - 245 o (WSW - ENE)
Receiver: Spectrum Communications 70 MHz to 144 MHz transverter feeding a Yaesu FT290-R, band pass 20 kHz.
Observing method: the squelch circuit in the receiver is sampled by an Acorn BBC model B microcomputer.

Counts of events during one hour bins starting at UT:

. & : affected by direct reception.
The criterion used: average duration during the hour > 1 s.

. * High Perseid activity on Aug 12 between 4 and 17 h UT (unfortunately
no observations between 10-12 h UT, when the anomalous peak took place).

R. Stapleton / C. Steyaert

Observer: George J. Zay
Location: Descanso, California, USA (116 38' W, 32 50' N)
Height above sealevel: 1003 m
Frequency: 92.90 MHz
Transmitter Location: Flagstaff, Arizona Distance: 538 Km
Transmitter Power: 100 kW; 24h/day and 7 days a week
Antenna: 6 element Yagi, Azimuth 60 o, Elevation 45 o
Receiver: JVC RX-302BK Digital Receiver
Observing method: Listening

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

: for example ... what does MA 20 to MA 50 mean ...

MA stands for mean anomaly. It is a number between 0 and 256. It is used to locate the satellite in it's orbit. For example, MA 0 means the satellite is at perigee (point where satellite height is minimum). At MA 128, the satellite is at apogee (point in orbit where satellite height is maximum). With MA between 0 and 128, the satellite is headed toward apogee. Likewise, if MA is between 128 and 256, the satellite is headed toward perigee. Note that MA 0 and 256 refer to the same point, perigee.

The MA is frequently used to indicate when transponders will be turned on and off during any orbit.

Are there any experts out there who regularly receive Webersat AO18 data.
I'm set up to receive AO16 with a PSK-1T & PB and all works ok but when I
try AO18 I have great difficulty in capturing any telm data.
The modem locks but it does'nt matter how carefully I tune I cannot get
any indication from the "con" led.
The same problem occurs using Weberware 1.3 capture. The system works
well with AO16 so the downlink to the PC seems ok.
Any help or advice would be appreciated.

Source record: 26612

:IF you were under the FCC's jurisdiction then whoever the REF is lied to you.
:You have every "right" to use RS-10, as long as you adhere to the limitations
:of your license class for transmissions leaving your antenna. If RS-10 chooses

:to retransmit your signals, that is RS-10's control operator's problem, not
:yours.

Not at all.. Here in France the law is not the same. By example, some
"beginners" licenses (FA...) do not allow to transmit on UHF, but only on VHF..
So the FA.. can not use any cross-band repeater that would re-transmit them on
UHF.
In fact the problem is harder: What should we think about packet, that forward
the message of a FA by example, on UHF, SHF, HF bands ?? Of course it would be
stupid not to allow packet to them because of this.. Some exeptions exists, and
RS10/11 is one of them.

1659. EME'ers in Seattle

^^^^^^^^^
Let me add a clarification since from e-mail received there is some misunderstanding. Mean anomaly (angle), when used for satellite tracking purposes, has values from 0 to 360. The mean anomaly is 0 at perigee and 180 at apogee. Values between 0 and 180 mean the satellite is headed toward apogee, values between 180 and 360 mean the satellite is headed toward perigee. However, MA is used in a somewhat different sense by the radio amateur Phase 3 satellite designers when refering to phase units. When MA is used to represent phase units, it has a range from 0 to 256. This was more convenient for the designers because of the microprocessor architecture used in the satellites. There is a direct relationship between phase units and "traditional" mean anomaly. To convert to phase units from traditional mean anomaly use:

Phase Unit = 256/360 * Mean Anomaly

I hope this helps to clarify the meaning.

1663. HELP!!! Any Way to Record Digital "Unattended"?

Newsgroup: rec.radio.amateur.space
Date: 1994-10-10 12:02:31 UTC
From: Ken Terry <ken_terry@macmail.eng.gulfaero.com>
Message-ID: <37bagnINNdsd@gulfaero.com>
Source record: 26617

I am trying to record unattended data from my icom while I am at work, but regular audio tape does not give me the resolution I need. Either DAT or minidisk was recommended. However, I cannot keep my computer on all day to control the recorder due to afternoon lightening storms. If you have been able to record unattended signals on a digital format, please let me know the secret.

In advance->Thank you very much!!

Ken

Yes, except for one ittsy bittsy detail. MA is from 0 to *255*, the
largest decimal number expressable in 8 bits. That's 256 *counts*
including zero.

1666. Phase schedules

Newsgroup: rec.radio.amateur.space
Date: 1994-10-10 19:32:12 UTC
From: courtney_duncan@jpl-335-server.jpl.nasa.gov
Message-ID: <courtney_duncan.1132205172A@llyene.jpl.nasa.gov>
Source record: 26619

Angles can be measured in many units:

circles : perigee 0, apogee 0.5
radians : perigee 0, apogee PI (3.141592653......)
degrees : perigee 0, apogee 180
grads : perigee 0, apogee 200
Meinzers : perigee 0, apogee 128

"Meinzers" were chosen to make the most use of 8 bits in representing the value. As long as you know how to use it correctly, it's just as good as any other unit. To have used integer degrees, you'd have to have a ninth bit, which would be wasted most of the time (much like the fourth bit in BCD), to have used radians, you'd need some kind of float (if you used standards) which is a bunch more bytes. (Radians are better if you're actually calculating trig values as part of the algorithm, which I don't think they do in the Phase III series, I think they just index into a table, another reason to use 0-255 base.)

Note that Mean Anomaly is uniform in time, not angle, so one mean anomaly unit (of any type) corresponds to much larger angle (in "true anomaly") near perigee than at apogee. For circular orbits, mean, true, (and eccentric) anomalies are roughly the same.

Needing a unit to describe 1/256th of a circle, some of the insiders coined the term "Meinzers" several years ago in honor of Dr. Dr. Dr. Karl Meinzer, DJ4ZC, one of the main European leaders in the amateur satellite program dating back to OSCAR 6 days. This is mainly because he made that selection and wrote the P3 software (in a language called IPS, similar to Forth).

Courtney, n5bf

Ed,

Listen for Lionel VE7BQH and the 2 Meter EME net on Saturday mornings. I think they would start about 9 or 10AM PDT on a frequency of 14.345 MHz.

If you would like a full listing of EME capable hams call the BBS at (704) 284-4854 (I forget the name). You will fing alot of EME related stuff including the current directory there.

Good Luck,
Terry KJ7F DN-13

1668. AEA DSP-1232 problem

Newsgroup: rec.radio.amateur.space
Date: 1994-10-11 02:58:18 UTC
From: rdhoughton@vms4.sci.csupomona.edu
Message-ID: <1994Oct10.195818.1@clstcs>
Source record: 26623

After some initial frustration, I have been able to get the STEP function on my AEA DSP-1232 multi-mode controller to work with modem 13 (Pacsat). Now, my question is this. While waiting to acquire the satellite, that is *before* the DCD light is active, the DSP unit continuously pulses the mic frequency change line. Short of adding a switch in the freq control line is there a way to avoid this. It seems like the STEP function should require the modem to hear a frequency error AND hear a carrier before is starts changing the frequency.

Additionally, when the radio (Yaesu FT-736R) transmits, if a freq stepping pulse arrives during the short time the radio is transmitting, the frequency is changed by 100 Hz since that is the smallest tuning increment while in the FM mode. Since the DSP unit thinks that it has stepped the VFO by 10Hz the modem jumps way off frequency. Does anyone have a workaround for this?

Thanks in advance,

Bob Houghton

* Polar orbits: lower case letters mean the pass is to east, upper to west
Maximum altitude above horizon: a=81-90 b=71-80 c=61-70 d=51-60 e=41-50
f=31-40 g=21-30 h=11-20 i=01-10 degrees

These satellites can be received with 2-meter or HF rigs. All times are
for the start of the pass. An average pass is 10-15 minutes long. For late
breaking news, listen to the EZSATS feature on `This Week in Amateur Radio',
Saturdays at 6:30 PM CDT on Galaxy 3, transponder 17, 5.8 MHz audio. Please
ask your local repeater owners to carry TWAR. For more info:

1673. WINSAT AMSAT Software Question

Newsgroup: rec.radio.amateur.space
Date: 1994-10-11 13:40:36 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <CxIGno.GCp@murdoch.acc.Virginia.EDU>
Source record: 26622

I just purchased AMSAT's WINSAT satellite tracking software.
The graphics are beautiful, but I can't get the package to do
two important things. First, I don't see how you can add new
satellites (orbital coordinates can be updated for the pre-loaded
satellites, but many are not included). Second, although the
package gives you current satellite locations, I can't see how
to have it plot several days' worth of alt-azi coordinates so
that one can determine the best "windows of opportunity."
Knowing where a satellite is at any given moment is nice but
knowing when it will be where you want it is a lot more
important. Ideally, one should be able to set requirements
(ie. alt >30 deg) and have the program tell you when these will
be met. Am I missing something here or is this a primitive
(first generation) program?

Please E-mail to: sem2r@galen.med.virginia.edu
Thanks, Stacey E. (Chuck) Mills / WB4QKT

Gary,
GRO is the Compton Gamma Ray Observatory. If I am not mistaken, UO is equivalent
to RS ? 22828 is just a NORAD object number for perhaps a new satellite but I do not know
what that one is.

UO-11 UoSat is an Experimental satellite from England. There are no Uplink Frequencies listed for this satellite. I cant seem to locate the description of the purpose of the satellite right now. The Down link frequencies are. 145.826, 435.025, 2401.50. I think this is a telemetery bird with Pictures as a primary component of that data stream..

Micros are the"Microsats" these are store and forward packet satellites.

POSAT is a Comercial/Ham satellite. Most of the time it is operating in the Comercial mode. Check 435.250 & 435.280Dn, 145.925 & 145.975Up.

UO-14 ? I don't have a listing for that satellite. There is OSCAR 21 or RS-14 which is a regular u/V mode satellite (Mode B).

22828 is the Norad number for ITAMSAT, Oscar 26.
POSAT is a Portuguese amateur satellite (with, interestingly, a
GPS receiver aboard).
GRO is the Compton Gamma Ray Observatory.

1678. EZSATS back on packet

UO-11 is UoSAT-2/OSCAR-11 from the University of Surrey. Launched over 10
years ago but still going strong. No uplink for the "public" use,
although the Digital Communications Experiment (DCE) was the first
successful amateur satellite store-and-forward facility and linked packet
networks in many countries.
Still sends data on 145.826 MHz at 1200 baud including news bulletins,
and is very easy to decode. This satellite has been extremely popular
with school groups over the years because of the simplicity of the
ground station needed.

UO-14 is UoSAT-3/OSCAR-14, which was the first of the 9600 baud microsats.
However it also carried a non-amateur package (a VITA project, I think)
and eventually the bird was switched to 100% non-amateur use so that
UO-22 could become 100% amateur, where it gave better service.
There was also a UO-15, launched at the same time, but sadly it failed
shortly after launch.

I have been using WinTrak 2.0 but have problems with its Doppler calculations. The author says there are no problems with it, BUT the Doppler values calculated by InstantTrack, WiSP, OrbiTrack, SatTrak all agree with each other (within a few Hertz) but disagree with WinTrak.

WinTrak often gives Doppler values with the wrong sign.

Has anyone else using this puppy?

I was interested in this program when it first came out so I called
the author to inquire about some details. I use a Kansas City Tracker
Tuner card to run things at the shack so I asked if he supported that
card. He said not only did he not support it but the KCT people were
out of business. This is news to L.L. Grace they think they are still
in business. Agreed there are some newer way to run your AZ/EL rotors
I think KCT must still be the most prolific system right now. He mostly
supports some parallel port box (can't remember which). Seems to me
this
guy is not a player in the satellite game, a view supported by your
experience.

Enough pontificating what are you to do?

Call AMSAT at 301-589-6062 they have a large selection of software all
of which WORKS get WISP if you want to use windows and forget WinTrak
as I have.

1685. TNC/Modem for PACSATS

Just getting into the digital satellite world.
Wonder what modem/TNC is being used by the community to receive
telemetry and operate through the PACSATS and other digital birds?
Are many of you using the AEA products (PK232, PK-96, PK900, or the
DSP series)? How easy is your terminal to use? What software is
usable?
Thanks, Mel W3MR robertsm@jsc.mil

1686. Amateur Static Satellite Tracking

Newsgroup: rec.radio.amateur.space
Date: 1994-10-13 17:12:12 UTC
From: caralt@gaig.upc.es
Message-ID: <37jppcINNco6@diable.upc.es>
Source record: 26636

I am gratefully surprised by all the interest showed through E-mail by this project. In response to all the people that required more information I would like to extend myself a bit further over the Static Satellite Tracking Device.
The system consists in a planar array of 19 elements. The disposition is crucial because of the frequency band I'm considering: UHF. By crucial I mean that a minute change in any of the describing factors of the array could ruin the beam shape and thus its directivity. This consideration is a hard limiter because it considerabily reduces the number of possible configurations
After a long period of tests and computer simulation I have decided that the best configuration is hexagonal, with all the elements spaced about half wavelength (this "about" is specially tricky) filling the hexagon in a triangular lattice. Many other configurations were considered (circular, square, linear, etc) but none proved to be so efficient in terms of directivity versus beam direction.
The next step is the control of the beam. We must take into account that most amateur satellites cross the sky in few minutes. Thus, an easy and fast control system must be used. Because I wanted the array to be totally static, the only way to move the beam is to gradually change the elements phase, as widely known. Using a small algorism I can find the adequate phase for each element and thus, direct the beam towards the place desired (that is, where the satellite is).
Another important decision to take is what radiating elements should be considered. As you
may well know, most satellites transmit with circular polarisation: that is because at this
frequencies is not possible to use linear polarisation because of Faraday's Rotation. So, we must find an element that, radiating together with the rest of the elements of the array, the transmitting-receiving electric field be circular polarised (the sense of rotation CW or CCW is also to be considered). I have carried out several computer simulations because I wanted to study the change in polarisation of the electro-magnetic field due too the changes of direction.
You all know about this: imagine a radiating loop placed in the XY plane. The polarisation in the z-axis (elevation=90 degrees) is circular (CW or CCW depending on the sense of the
feeding current). But as you decrease elevation, polarisation is no longer circular but elliptic. So, if the satellite is transmitting circular we get signal loss, depending on the excentricity of the ellipse. I've concluded that the best option is to use crossed half wave dipoles fed by equal current amplitude but a phase shift of 90 degrees to obtain circular polarisation.
Computer simulation showed that we can get almost 16 dB of directivity (gain) at elevation angles of 30 degrees. This means that the array can track satellites in a range of 120 degrees, which I thing is quite remarkable. If we can accept a loss of 3 dB the range increases to 140 degrees.
At present, I'm working on the design of the RF part. Things to solve are

(suggestions will be welcome):

1. Normally arrays have much noise problems than other devices. Fortunatelly I found an article containing some solutions, but eventhough we must use a pre-amp for each element. This amplifier has to have a good noise figure (and has to be cheap too!). I've been searching quite thoroughly but I can't find a suitable transistor (Phillips, Siemens, Advantek, etc).

2. The usage of a pre-amp implies a switching device that differenciates the tansmitting and the receiving. I would like to use an electronic device if possible, but a mechanic one should prove fine provided is easy to switch.

3. Phase shifters are made of lines of different lengths. The appropiate one is selected by diodes, depending of the phase the radiating element has to have. Because we are working with RF signals, the parasite condenser must be very low. PIN diodes have very low values, but are difficult to find.

I would also thank anyboody that could give information on:

4. Is there any phase shifter in chip?
5. Is there anybody who knows something about high directivity planar arrays? Am I the first to attempt doing such a device?
6. If you are an Amateur Satellite operator, I'll be delighted to know something about the most usual problems you have to cope with.

Yours faithfully

The RS (Radio Sputnik) are a Soviet series of amateur-radio-containing
satellites (that is, they are parts of a larger satellite; RS-14/15 are
two experiments on one spaceframe); their numbering is not part of the
OSCAR series. The UO-xx are University of Surrey (Guildford, Surrey,
UK) satellites, numbered in the OSCAR series. UO-14 is no longer
operational on amateur frequencies. Object 22828 _may_ be the actual
object number for KO-25; use KO-25 frequencies. UO-11 has beacons on
145.826, 435.025, and 2401.5 MHz; no open transponders.

What "resolution" *do* you need? What do you mean by "resolution?"
What "data" are you trying to record? Is "digital" absolutely necessary?

If your signals are audio, you might try a hi-fi VCR; you'll get wonderful
fidelity on a two-hour tape, and it can turn *itself* on and off at
predetermined times.

1689. Re: AEA DSP-1232 problem

Newsgroup: rec.radio.amateur.space
Date: 1994-10-13 23:12:31 UTC
From: Dean Shutt <shuttd@arco.com>
Message-ID: <CxMwGw.Frp@news.arco.com>
Source record: 26644

My solution was to use a batch file that does not turn STEP to on until AOS. I am running a fully automatic station using Satsked.

1690. Question on AO13 schedule

Newsgroup: rec.radio.amateur.space
Date: 1994-10-14 16:18:24 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <37mb0g$pda@newsstand.cit.cornell.edu>
Source record: 26650

Hi,

I'm getting active on AO13 again after about a year off, and I don't seem to be hearing it when I think I should be. Last night around 11 EDT I was listening to the beacon fine, but nobody was on the passband and I couldn't hear myself on it either. IT said that the phase was about 89 or so. Copying the data from the beacon said it should be in Mode B from 230 to 150, then pick up again at 190 (I take it it is off from 150 to 190?)

I know my station didn't suddenly go deaf, I can hear the beacon. I think it's on omnis for most of the lower half of the orbit because of bad pointing angles, but I worked it the other night well and heard a lot of folks on. Obviously I'm missing something, and when someone points it out I'll probably go "Duh!", but right now I'm confused.

I'm guess that the schedule is not as I think it is - so maybe someone can walk me through it.

Also, I've been listening for about a week or two, and haven't heard G4JUJ (Blimey!) on at his accustomed spot, nor the 890 gang. Where'd they all get to? They were my most reliable signal sources and fun to chat with.

1693. More Static Satellite Tracking Device

Newsgroup: rec.radio.amateur.space
Date: 1994-10-14 19:30:32 UTC
From: caralt@gaig.upc.es
Message-ID: <37mm8oINNpi0@diable.upc.es>
Source record: 26641

I am gratefully surprised by all the interest showed through E-mail by this project. In response to all the people that required more information I would like to extend myself a bit further over the Static Satellite Tracking Device.
The system consists in a planar array of 19 elements. The disposition is crucial because of the frequency band I'm considering: UHF. By crucial I mean that a minute change in any of the describing factors of the array could ruin the beam shape and thus its directivity. This consideration is a hard limiter because it considerabily reduces the number of possible configurations
After a long period of tests and computer simulation I have decided that the best configuration is hexagonal, with all the elements spaced about half wavelength (this "about" is specially tricky) filling the hexagon in a triangular lattice. Many other configurations were considered (circular, square, linear, etc) but none proved to be so efficient in terms of directivity versus beam direction.
The next step is the control of the beam. We must take into account that most amateur satellites cross the sky in few minutes. Thus, an easy and fast control system must be used. Because I wanted the array to be totally static, the only way to move the beam is to gradually change the elements phase, as widely known. Using a small algorism I can find the adequate phase for each element and thus, direct the beam towards the place desired (that is, where the satellite is).
Another important decision to take is what radiating elements should be considered. As you may well know, most satellites transmit with circular polarisation: that is because at this frequencies is not possible to use linear polarisation because of Faraday's Rotation. So, we must find an element that, radiating together with the rest of the elements of the array, the transmitting-receiving electric field be circular polarised (the sense of rotation CW or CCW is also to be considered).I have carried out several computer simulations because I wanted to study the change in polarisation of the electro-magnetic field due too the changes of direction.
You all know about this: imagine a radiating loop placed in the XY plane. The polarisation in the z-axis (elevation=90 degrees) is circular (CW or CCW depending on the sense of the
feeding current). But as you decrease elevation, polarisation is no longer circular but elliptic. So, if the satellite is transmitting circular we get signal loss, depending on the excentricity of the ellipse.
I've concluded that the best option is to use crossed half wave dipoles fed by equal current amplitude but a phase shift of 90 degrees to obtain circular polarisation. Computer simulation showed that we can get almost 16 dB of directivity (gain) at elevation angles of 30 degrees. This means that the array can track satellites in a range of 120 degrees, which I thing is quite remarkable. If we can accept a loss of 3 dB the range increases to 140 degrees.

At present, I'm working on the design of the RF part. Things to solve are (suggestions will be welcome):

1. Normally arrays have much noise problems than other devices. Fortunatelly I found an article containing some solutions, but eventhough we must use a pre-amp for each element. This amplifier has to have a good noise figure (and has to be cheap too!). I've been searching quite thoroughly but I can't find a suitable transistor (Phillips, Siemens, Advantek, etc).

2. The usage of a pre-amp implies a switching device that differenciates the tansmitting and the receiving. I would like to use an electronic device if possible, but a mechanic one should prove fine provided is easy to switch.

3. Phase shifters are made of lines of different lengths. The appropiate one is selected by diodes, depending of the phase the radiating element has to have. Because we are working with RF signals, the parasite condenser must be very low. PIN diodes have very low values, but are difficult to find.

I would also thank anyboody that could give information on:

4. Is there any phase shifter in chip?
5. Is there anybody who knows something about high directivity planar arrays? Am I the first to attempt doing such a device?
6. If you are an Amateur Satellite operator, I'll be delighted to know something about the most usual problems you have to cope with.

Yours faithfully

Shelley,

A while back, I posted a message in this forum regarding the availability, for downloading, of data from the SETI project. Unfortunately, I was never able to confirm whether there were any responses to the posting. Do you have any leads?

Thanks,
MichaelMK

1696. Orbital Element Sets Wanted

Newsgroup: rec.radio.amateur.space
Date: 1994-10-14 22:15:38 UTC
From: lynch@stars.gsfc.nasa.gov
Message-ID: <lynch.108.2E9F030A@stars.gsfc.nasa.gov>
Source record: 26643

Hello element heads,

I am looking for as much historical data regarding satellite orbits as I can find. I already got as much as I could from Dr. Kelso, and I am now hoping that someone on the net has an archive of these data.

I am currently researching atmospheric models and satellite drag, so historical info is more valuable than the current sets.

If anyone has any, or has an idea where to look, please let me know.

Thanks,
Dave Lynch

1697. Two-Line Orbital Element Sets (TLE486)

Newsgroup: rec.radio.amateur.space
Date: 1994-10-14 23:56:20 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.782178980@eel>
Source record: 26659

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1698. RS birds usual down link

Newsgroup: rec.radio.amateur.space
Date: 1994-10-15 14:33:14 UTC
From: brucerob@blues.epas.utoronto.ca
Message-ID: <37op7a$hod@alpha.epas.utoronto.ca>
Source record: 26645

I'm attracted to the RS series of birds as a first foray into satellite work. In particular, the 10m downlink seems very practical at this point in the sun spot cycle. I have, then, a few questions for the experienced:
1. I'm thinking of homebrewing my transmitter. Is the uplink usually 21 MHz, 144 MHz or evenly split between them?

2. What sort of power is practical for casual use of these birds? I have heard of qsos with 2w in a dipole; is that remarkable or par for the course?

3. Has anyone any experience using mobile whips (argh) as antennae for this application?

Thanks in advance, VE3UWL

I am just getting into the Mosaic end of the Internet and am
wondering whether there are any HTML encoded WWW pages that showcase the
various AMSAT satellites. If there isn't something like this now it
would be a nice idea to have something like this.

From: icesb@iroe.fi.cnr.it
Message-ID: <icesb.44.2EA24CFE@iroe.fi.cnr.it>
Source record: 26652

Some question on the MIR:
1) What about ham activity on MIR station ?
2) Is there a store and forward access,and when is active ?
3) Where is R2MIR-1 ?
4) I've heard that RV3DR is the QSL manager for MIR hamradio, is there an
internet address for RV3DR?
Thanks a lot in advance

1703. Upload and display problems with WISP

Newsgroup: rec.radio.amateur.space
Date: 1994-10-17 16:18:04 UTC
From: marcoh@world.std.com
Message-ID: <Cxtry5.B5A@world.std.com>
Source record: 26657

I am relatively new to digital satellites, but have successfully downloaded files from AO-16 and LO-19. I'm using the 2207 version WISP, and when I attempt to upload, after apparently transmitting the whole file (~800 bytes), WISP tells me "file not accepted by server".

Also, if you use WISP, do you find that the AOS/LOS display in the upper left corner of GSC overwrites part of the pass prediction and radio button displays?

If you know the cause or possible causes of these errors, would you please email me and I will summarize to the net.

Many thanks,

Marco

Jordi Caralt Barba (caralt@gaig.upc.es) wrote:

(about planar phased electrically steerable antenna arrays)

: 5. Is there anybody who knows something about high directivity planar arrays?
: Am I the first to attempt doing such a device?

Back when I was fresh out of engineering school in 1978, I interviewed with Raytheon in Massachusetts. One of the things they showed me that they were working on was a UHF radar system for the military. I believe it was called PAVE-PAWS or something like that. It used large arrays of phased antennas (actually individual receiver/transmitters I think), and the beam was steered by controlling the phase at each antenna. I believe their system consisted of dozens or maybe even hundreds of antennas.

The one thing that really stuck out in my mind at the time was seeing the test equipment indicating frequencies right in the amateur 450 MHz band!

Perhaps there's someone around who worked on that thing that can supply more information.

The tricky thing, I would think, would be controlling the phase accurately enough; keeping it stable with temperature, and keeping the phase delays through any active elements consistent from antenna to antenna. I know from cutting 1/4 wave transmission lines on 450 MHz, that just a few millimeters of error can move you many MHz in frequency.

Lots of luck!

primary use, amateur is secondary.

To which I add:

Check out the FCC Rules, in particular the ARRL printed version. You'll
see a couple of footnotes dealing with power limitations within 100-200
km of various USAF bases around the continental US, including Otis AFB
in Massachusetts, Eglin AFB in Florida, Offutt AFB in Nebraska (?), and
several others that I can't remember offhand. In fact, the rules were
tweaked a few years ago to permit 70cm amateur satellite uplink operation
in such a way so as NOT to cause interference with the PAVE/PAWS gear.

Also, don't forget that we're now explicitly sharing 449-450 with wind
shear warning equipment as well. Also, we cannot use 420-430 north of
Line A (to prevent QRM to Canadian land mobile users) nor within 50 miles
of certain major US cities along the Great Lakes (Buffalo, Cleveland,
Detroit, and some others). In all cases, we're definitely the
secondary allocation.

73,

Bayard, N1HO, in FN43ig (south of line A, way north of Otis AFB and
nowhere near the Great Lakes !)

1708. RE: Next Sarex STS flight is STS-67

Newsgroup: rec.radio.amateur.space
Date: 1994-10-19 20:49:35 UTC
From: pchien@ids.net
Message-ID: <3850k2$2r0@paperboy.ids.net>
Source record: 26577

The next shuttle flight with SAREX manifested is STS-67, the Astro-2 mission next February. The primary ham on the mission is Dr. Ron Parise WA4SIR, who you may remember from the STS-35 SAREX ASTRO-1 (notice how I place the more important payload first) mission of December 1990.

Several other crewmembers have expressed an interest in getting their licenses, the commander Steve Oswald already has his licence from a previous mission (and I can't remember his call sign!), Wendy Lawrence and Sam Durrance have taken their tests and are waiting for their call signs, etc.

Regretably SAREX is not flying on the STS-66 mission in November or the STS-63 mission in early February - even though both of those missions have astronauts assigned who have valid amateur radio licenses.

Date: Wed, 19 Oct 94 16:39:17 MDT

/\

SATELLITE PROTON ENHANCEMENT ALERT

ISSUED: 03:30 UTC, 16 SEPTEMBER

/\

ATTENTION:

Protons at greater than 10 MeV became enhanced near 02:00 UTC on 16 September and are continuing to slowly rise. At the present time, protons at greater than 10 MeV are near 2 pfu. It is unlikely that the current enhancement will actually reach event levels of 10 pfu, although there is an remote chance this might happen.

The source of this activity is unknown, but most likely can be attributed to a solar region which departed the west limb several days ago. No x-ray enhancements of significance preceded this activity, supporting the notion that the source region might be some distance behind the west limb occulting the x-rays.

Warren just read your mail on the Hamsat Handbook and it seem like that is the perfect thing I am looking for. However, did you give the correct date for the "up to date" information of Feb. 1993? If this is incorrect could you please give the correct up to date information. If this date was correct then I will just wait to purchase a copy at a later date.

Also I will ask you since you seem to be interested in satellites, what has happened to AO-21? I am just getting into satellite communications and don't have all the proper equipment as of yet but I use to enjoy listening to Oscar 21 but haven't heard a peep out of it in over a week. Can you help? Thanks for everything. 73 de Jimmy (KD4ISP)

: 1. I'm thinking of homebrewing my transmitter. Is the uplink usually
: 21 MHz, 144 MHz or evenly split between them?

My limited experience with this bird is that RS-10 is the one that is
usually ON (RS-10 and RS-11 cannot operate at the same time).

I've never tried 15m up yet (antenna situation prevents this at the
moment), but when I was active, I was able to uplink on 2m often. You
can determine the mode by the CW telemetry, but with a 10-20 minute pass
max, you don't waste much time -- just try it. There is one mode that
accepts both 2m & 15m uplinks at the same time:

Mode KA: Uplink 21.160 - 21.200 21.210 - 21.250
Uplink 145.860 - 145.900 145.910 - 145.950
Downlink 29.360 - 29.400 29.410 - 29.450
BEACON 29.357 | 29.403 29.407 | 29.453
Robot: Uplink 21.120 21.130
Uplink 145.820 145.830
Downlink 29.403 | 29.357 29.453 | 29.407

Perhaps Mode KA is the "usual" mode?

: 2. What sort of power is practical for casual use of these birds?
: I have heard of qsos with 2w in a dipole; is that remarkable or par
: for the course?

I have heard my downlink with 3 watts on a good day. I'd suggest 5 - 10W
would be a good starting place for 2m uplinks. I have no 15m experience
on this bird.

: 3. Has anyone any experience using mobile whips (argh) as antennae for
: this application?

Adventurous aren't we?

: Thanks in advance, VE3UWL

>Also, I've been listening for about a week or two, and haven't heard
>G4JUJ (Blimey!) on at his accustomed spot, nor the 890 gang. Where'd
>they all get to? They were my most reliable signal sources and fun to
>chat with.

You may have experienced one of the times when the transponder is turned off.
I don't have the schedule in front of me, but there will be some times when it
is off due to the Earth eclipsing the satellite. I haven't been on mode B for
a while, so I can't tell you what happened to the "Blimey Limey".

Have Fun!

This is a tough one. What TNC are you using?

>Also, if you use WISP, do you find that the AOS/LOS display in the
>upper left corner of GSC overwrites part of the pass prediction and
>radio button displays?

Try sizing the window larger. If this does not work, check your video driver
to see if there is one for "Small Fonts".

For the version of Wisp, use the numbers found in the Help-About box. I can't
tell from the numbers you gave above.

Bill

1716. Re: AO-21

Newsgroup: rec.radio.amateur.space
Date: 1994-10-20 18:45:16 UTC
From: 70353@gspc.lanl.gov, 403@compuserve.com
Message-ID: <386eeu$78a@newshost.lanl.gov>
Source record: 26561

Unfortunatly AO-21 has gone silent transponder. I have been in
contact with Peter Guelzow the control operator for the Amateur part
of AO-21 and he is at a loss as to what the trouble might be.
I understand that thermal and attitude control was abandoned
several weeks ago, after the last scheduled experiments were
completed. This is a tragic loss to the amateur satellite community,
as you noted it was a great place for the newcomer to get
started. It may be as simple as a pointing problem since the
attitude is no longer under control. If you want to ask for more
detail Peter can be e-mailed at db2os@amsat.org. I am particularly
sorry to see this bird go as we had a major expedition counting
on using it while in the arctic. Sorry to bring sad tidings

1717. More Satellite tracking for amateurs

Newsgroup: rec.radio.amateur.space
Date: 1994-10-21 18:26:13 UTC
From: caralt@gaig.upc.es
Message-ID: <389145INN5th@diable.upc.es>
Source record: 26566

I am gratefully surprised by all the interest showed through E-mail by this project. In response to all the people that required more information I would like to extend myself a bit further over the Static Satellite Tracking Device.
The system consists in a planar array of 19 elements. The disposition is crucial because of the frequency band I'm considering: UHF. By crucial I mean that a minute change in any of the describing factors of the array could ruin the beam shape and thus its directivity. This consideration is a hard limiter because it considerabily reduces the number of possible configurations. After a long period of tests and computer simulation I have decided that the best configuration is hexagonal, with all the elements spaced about half wavelength (this "about" is specially tricky) filling the hexagon in a triangular lattice. Many other configurations were considered (circular, square, linear, etc) but none proved to be so efficient in terms of directivity versus beam direction.
The next step is the control of the beam. We must take into account that most amateur satellites cross the sky in few minutes. Thus, an easy and fast control system must be used. Because I wanted the array to be totally static, the only way to move the beam is to gradually change the elements phase, as widely known. Using a small algorism I can find the adequate phase for each element and thus, direct the beam towards the place desired (that is, where the satellite is).
Another important decision to take is what radiating elements should be considered. As you
may well know, most satellites transmit with circular polarisation: that is because at this
frequencies is not possible to use linear polarisation because of Faraday's Rotation. So, we must find an element that, radiating together with the rest of the elements of the array, the transmitting-receiving electric field be circular polarised (the sense of rotation CW or CCW is also to be considered). I have carried out several computer simulations because I wanted to study the change in polarisation of the electro-magnetic field due too the changes of direction. You all know about this: imagine a radiating loop placed in the XY plane. The polarisation in the z-axis (elevation=90 degrees) is circular (CW or CCW depending on the sense of the feeding current). But as you decrease elevation, polarisation is no longer circular but elliptic. So, if the satellite is transmitting circular we get signal loss, depending on the excentricity of the ellipse. I've concluded that the best option is to use crossed half wave dipoles fed by equal current amplitude but a phase shift of 90 degrees to obtain circular polarisation.
Computer simulation showed that we can get almost 16 dB of directivity (gain) at elevation angles of 30 degrees. This means that the array can track satellites in a range of 120 degrees, which I thing is quite remarkable.
If we can accept a loss of 3 dB the range increases to 140 degrees.

At present, I'm working on the design of the RF part. Things to solve are (suggestions will be welcome):

1. Normally arrays have much noise problems than other devices. Fortunatelly I found an article containing some solutions, but eventhough we must use a pre-amp for each element. This amplifier has to have a good noise figure (and has to be cheap too!). I've been searching quite thoroughly but I can't find a suitable transistor (Phillips, Siemens, Advantek, etc).

2. The usage of a pre-amp implies a switching device that differenciates th transmitting and the receiving. I would like to use an electronic device if possible, but a mechanic one should prove fine provided is easy to switch.

3. Phase shifters are made of lines of different lengths. The appropiate one is selected by diodes, depending of the phase the radiating element has to have. Because we are working with RF signals, the parasite condenser must be very low. PIN diodes have very low values, but are difficult to find.

I would also thank anyboody that could give information on:

4. Is there any phase shifter in chip?
5. Is there anybody who knows something about high directivity planar arrays? Am I the first to attempt doing such a device?
6. If you are an Amateur Satellite operator, I'll be delighted to know something about the most usual problems you have to cope with.

Yours faithfully

RS-10 and RS-11 are on the same satellite. RS-11 is in standby until RS-10 fails.

Ditto for RS-12 and RS-13. RS-13 is in standby until RS-12 fails.

RS-10 has operated mode A (2 meters up and 10 m down) for years.
RS-12 has operated mode K (15 meters up and 10 m down) for years.

If you key up your HT/rubber duck on a quiet RS-10 pass, you can often hear it on the downlink. Morse QSOs have been accomplished by keying HT PTT switches.

Hi,
Over the last two weeks, I tried to pick up the MIR beacon at 145.55MHz,
so far to no avail. At two times, I tried to actually see MIR during
visible passes but: nada!
I use the orbital elements from ARCHIVE.AFIT.AF.MIL which should be accurate.
So my question:
Anybody else having problems to pick up MIR?

Arne

>So my question:
>Anybody else

Everybody else. Mir has had a power generation problem, so the Amateur
equipment was turned off. I have heard that there were rare exceptions during
Europe passes. I have also heard that by the time you read this, the problems
should be fixed and you should be able to get them.

I guess it's about time I tuned them in. U3MIR was my first contact as an
Amateur.

Have fun!!!

There is a control packet sent back from the spacecraft to the ground saying
that the file's checksums did NOT check. This could easily happen if
the data between your computer and your TNC gets corrupted. This happened
to me regularly until I replace the piece of crap cable talking 38400 bps
to my DSP2232 with a `real' RS-232 shielded ($35) cable.

B for
>a while, so I can't tell you what happened to the "Blimey Limey".
>
>Have Fun!

that is what I was wondering, but according to the lastest stuff on the satellite's beacon, it should have been on. Now it has off times, since OCT 22, but this was 2 weeks ago. I think we have about 2 months of off for eclipse times coming up, then the pointing will be better again and the schedule more normal.

I used to do mode JL, but now that that's gone, I'm B only. Don't have a converter for S, though maybe next year....

Thanks

Kevin

1731. FM reception on HT - any advice?

Newsgroup: rec.radio.amateur.space
Date: 1994-10-26 14:55:54 UTC

Hello,

I was wondering what the odds of picking up
a FM 2meter downlink on a HT. I thought
Oscar-21 would be possible but it appears
there is conversation that it is sick now...
are there any others...transmitting a strong
enough signal (FM 2meters) to receive on an
HT....lets assume a good pass also....

any replies would be greatly welcomed..I
am new to amateur radio and have a growing
interest in the satellites...I only have
a 2meter HT now so I think my options are
limited to listening to downlinks.

Thanks,

Dave Donovan

> ddonovan@mayo.edu

I have worked several stations on AO-27 using only
a HT and a 1/4 wave wip antenna. "It can be done!"

AO-27, 145.850 MHz FM up
436.800 MHz FM dn

AO-27 is only a part time amateur satellite FM repeater, weekends
ONLY! During amateur usage, its on solar panel engery only. This
means the satellite needs to be on the sunny side of its orbit
(daytime at your QTH).

Be sure to adjust for doppler shift. At the beginning of the pass,
start listening around 436.805 to 436.810 MHz and tune downward
as the pass proceedes. At the end of the pass, you will be tuning
around 436.760 MHz

Actually modern HT's can pick up fairly weak signals. I know the Dove satelite was operating ok and you can pick up its signal, but I cant remember its freq. It would be a little more exciting if you had a TNC packet controler, then you could see its signal. Make sure that it is in fact still operating.
I have heard the Mir Satellite (The Mirs has battery probs at the moment and can be heard only sporaticaly). I have also been able to transmit and be heard and retransmited by Mir using packet. My longest connect has been in Canada and I live near San Francisco!!! This was all done by my HT at less than 5 watts!!
I have also heard some of the crew on STS-64 space shuttle flight with my HT.
I tried to make contact to them through sarex, but there were a whole lot of other people trying at higher power.
A great book to get is ARRL's Satelite Handbook. With a homemade groundplane antena and perhaps an inexpensive preamplifier you could be hearing
a lot with your HT!!
Have Fun

Walt

Code 500 at Goddard Space Flight Center has established an Online Information Server (OLIS) to allow remote users browsing current Blue Books and Green Books through Internet. These Recommendations have been prepared by the Consultative Committee for Space Data Systems (CCSDS).

The OLIS provides many access and retrieval methods (e.g., WAIS, FTP, Gopher, Mosaic). Regardless of platform used (e.g., Mac, PC, Unix), a remote user can download text file of various CCSDS Blue Books and Green Books. Postscript format of these documents is also available for remote user who does not have the same word processing application software that was used to create the original document.

Document in its native format (e.g., Word) can also be retrieved.

You can ftp or run gopher to ddwilson.gsfc.nasa.gov, or
Open URL to http://ddwilson.gsfc.nasa.gov/CCSDS-A.html.

We could go on here for weeks, and only scratch the surface, so I'll refer you to a book, Satellite Experimenters Handbook. Available from good Ham stores and mail order.

Weather satellites are an entirely different service. Try Weather Satellite Handbook, same sources.

Have fun!

Here some advices, to get started quickly:

1) get a satellite tracking program from an FTP site, get
the orb. data from the Newsgroup, and tune one of your scanners
to 137.620 MHz or 137.750 (not sure on the 2nd one) for the NOAA
satelites. Use an out door antenna though.

2) When you receve a good sig, get the program JVFAX, ver. 7,
and a faxconverter. (there are some vy simple designs around,
also for the WX sats, the JVFAX manual might help).

3) Once it works, you might want to use a proper antenna (eg.
turnstile) and a preamp...

Have fun, Moritz DL5UH

Hi Jim:
Probably the best person in the field would be to contact Bill Brown, WB8ELK
since he keeps abrest of what works and what does not. You can contact him
directly at wb8elk@delphi.com and tell him KA9SZX sent you.
He will also have a list of people in your area who can help you too.
Good luck in your project
P.S. Bill only checks into his account every so often so you may have to
wait a few days.

Hi,

Can anyone tell me the minimum requirement to work the MIR.
I am using a 7/8 lambda Diamond F-22 vertical mounted on roof. Also
using IC-22A on 145.550 MHz with 10watts output. Is this sufficient
to work the MIR? The last pass we tried was about 440km nearest.

Tried for abt 50 minutes about the 3 minute window. No QRM
or obstructions but QSO either. Would appreciate any help. Would a
YAGI be necessary?

73,
RSM

You can can also ftp FAQSAT.TXT from the ARRL info site.They can be retrieved
from oak.oakland.edu pub/hamradio/arrl/infoserver
Or if you only have e-mail you can send mail to info@arrl.org, in the body of
the text it should contain only the file name then quit on a seperate line. In
this case; send faqsat.txt
quit
There you go, that should do you.

1757. Satellite tracking software needed

Newsgroup: rec.radio.amateur.space
Date: 1994-10-30 20:38:55 UTC
From: gkennedy@helix.net
Message-ID: <Yp$ikClgn6iJ055yn@helix.net>
Source record: 26610

Hello All !!!

I am looking for an MS-DOS based satellite tracking program which
will produce a tabular prediction *text file* output for "visible" passes.

There is one hitch.....the output, in addition to AOS/LOS times and
Alt/Az info, *** MUST contain the ORBIT NUMBER for each pass. ***

I have tried STSPLUS and TRACKSAT, and neither of these give me that
information in their "analytical" modes....

I need this information to assist me in cataloging of NOAA imagery I
am now receiving. Right now I am entering this information manually
(and it takes a fair chunk of time!), but I want to automate the process
in the very near future.

Is there anything from, say, AMSAT which does this ?? If so, how can
I get my grubby little hands on it ?? <GRIN>

Thanks in advance.

The antenna is the exact opposite of what you want. The F-22 (and all gain
verticals) get their gain by concentrating the signal toward the horizon.
The problem is that MIR is UP, not at the horizon! Don't feel alone, when
I worked at HRO, this would happen with someone once a day at least.

Try an antenna called a "Crossed Dipole". I used one for years for MIR
and Sarex. It points up toward the satellites. For a good description, look
in the Satellite Experimenters Handbook for it.

>Please respond via email.

>John KD7UW

VITA has done a lot since then! We "sponsored" the Digital Communications
Experimenot on the UoSAT-2 (UO-11) satellite. We then were involved in
the development of the Pacsat Communications Experiment on UoSAT-3
(UO-14), which still operates as a non-amateur store and forward
satellite for VITA.

We're now in the next phase of the satellite project, where we will
launch our own satellite at the end of the year.

Any more questions, please ask!

Excellent advice. If those books get you hooked then you could do worse than
join Amsat (don't have the US address). In the meantime, tune your 2m FM
receiver to 145.825 and listen for Dove DO-17 (I haven't been following it
recently so it may be temporarily off again).

Mike.

>info on the bird????

AO-21 (RS-14) is off the air. The host satellite, Informator-1, had reached the end of its intended life, and the command station was unwilling to maintain the bird due to budget problems. There is a small amount of hope from those who were directly involved with RS-14 that something might be worked out to have Informator be able to provide some power.

That was the last I heard. Lets hope that something can be done!

1763. AO-27 Questions

Source record: 26516

Does anyone have any information about AO-27. I have worked this satellite when it was operating in amateur mode J. What is this used for in the commercial service? What modulation techniques are used. I assume that the frequencies are near the 430 and 2 meter amateur bands. Any information would be appreciated.

Unfortunately, this is bad advice. An analysis of all possible passes
for a LEO sat shows that it will spend the majority of the time you
are in it's footprint at an angle of less than 30 degrees above the
horizon. The turnstyle over a groundplane advocated in the SEH has
a *null* at those angles. For a non-steerable antenna, a simple
quarterwave vertical works better (at least 3db better, usually more).
It has a null straight up, but the sat will spend a very short time
directly overhead, and path loss is least during that period. During
the low part of passes (below 20 degrees), a gain vertical can be very
useful. This was reported in the AMSAT Journal a few years ago, but the
SEH hasn't been updated. A better non-steerable antenna is the Lindenblad.
It offers a flattened hemispheric coverage with circular polarization.
CP is a big advantage due to spin modulation on most sats, I highly
recomend building one of these if you aren't going to be using steerable
antennas. (I haven't analyzed the new "eggbeater" style antennas, but I
expect they're better than crossed dipoles too.) The only time the crossed
dipole has the edge is in direct overhead passes. Those are relatively rare,
and the amount of time the sat is directly over any given spot is a very
short time compared to the total time you'll be in it's footprint.

Greetings All:

On Oct 6/94 we picked up a NBFM downlink as we were motoring
along the transCanada highway in Manitoba. We were scanning two metres
and ran across the downlink in the 145 MHz segment of the band. It was
interesting to monitor stations from all over the U.S.A. working a
Canadian VE5 station. The downlink was full quieting!

Can anyone identify which satellite we picked up.

Very Best Regards,

T.M. Alldread,R.R.#4,Site 430,C7,Courtenay, BC,V9N-7J3

1768. why are elements published for...

Newsgroup: rec.radio.amateur.space
Date: 1994-11-01 01:25:27 UTC
From: larson@loren.net.com
Message-ID: <3945e7$gmo@unet.net.com>
Source record: 26521

I noticed that elements are published for ARSENE, 22828, POSAT, HUBBLE, GRO, and UARS.

I know what Hubble, GRO, and UARS are, but don't know why I would want to track them? Any hints of what I might be missing from them?

I remember ARESNE, but didn't think there was much that most would want to track. I thought it had problems -- was it recovered when I was not looking (hopefully!).

I plead ignorance on 22838 and POSAT. I would find any information about them interesting.

So, what am I missing up there with these?

Thanks,

Alan

Not only the above, but the Mir is curently plagued with battery problems. Although they operate their radio occasionaly, they are not able to operate on any kind of schedule. I hear that next year (with help from space shuttle maybe) they may be able to fix this problem. You may get lucky though!

These are mostly done automatically from lists, and I suspect that Arsene was never removed when it died. 22828 is listed because Norad keeps getting it confused with KO-25. In fact, 22828 elements are currently KO-25, but both are sent because Norad might get the problem straightened out at any time.

Posat is the same situation as Arsene. I don't know why the Observatories are in these. Maybe it is because they are easily visible at the right time?

It was AO-21 on 2 meters. Unfortunately, it was soon after turned off. For a similar satellite, try AO-27 during the day on 436.800, and the Russian Space Station MIR on 145.550.

Alan,

I suspect these are included because they are contained within the standard set of elements that originate from NORAD. Other entities such as AMSAT separate out various birds into different categories (i.e., separate out the Ham Radio Sats) and provide different files for
these. Also, some people just like to know where these other sats are either for professional
or general curiousity (e.g., I wonder what that moving star was overhead last night ?).

Just my opinion

Gary's inappropriate and lengthy analysis deleted.

Gary's analysis makes sense if you are interested maximizing the
time you can work MIR, as opposed to just working them once.

Advantages of the MIR overhead:
Minimum path loss--shortest distance, fewer obstructions
Good possibility of low background noise
If you are in Hawaii or someplace similar
the competition is out of range.
Minimal doppler

I'm sorry you choose to reject AMSAT's best advice (it's not my
analysis, the work was done by brighter and more capable people
than me).

>Gary's analysis makes sense if you are interested maximizing the
>time you can work MIR, as opposed to just working them once.

AMSAT's analysis makes sense if you want to maximize your chances
of working MIR, or SAREX, or any other body in LEO, *at all*.
Direct overhead passes are rare, and MIR's operation schedule in
particular is currently erratic. Using an antenna system that
favors the majority of time you'll be in the footprint will
maximize your chance of working them *once*.

>Advantages of the MIR overhead:
> Minimum path loss--shortest distance, fewer obstructions
> Good possibility of low background noise

Neither of these are of much concern at 145.55 MHz. The signals
are quite strong, even near the horizon, if the antenna used
doesn't place a null there. Background noise, aside from local
manmade noise, simply doesn't enter into the picture. This is
not extreme weak signal work.

> If you are in Hawaii or someplace similar
> the competition is out of range.

This is true, but has little to do with the type of antenna
used. Competition is a concern in the continental US or over
Europe, but competition ism't much of an issue in Hawaii or
Singapore (as is the case here). There will be relatively
few competing stations in the footprint since it will be
mostly over empty ocean, or over areas with low amateur

populations.

And an antenna optimized solely for the overhead pass does *not* reduce interference from competition. Unless they too are using strictly overhead optimized antennas, they can be anywhere in the footprint and still put a good signal up to the satellite. You will only be able to put a good signal up at one time at one point. So using an antenna optimized solely for the overhead pass will reduce your competitive chance of getting a signal in edgewise.

> Minimal doppler

In point of fact, doppler is changing most rapidly during the overhead portion of the pass as range and bearing from your station are changing most rapidly. Doppler changes are much less during the lower inclination parts of the pass.

Gary

In addition, when the bird is close to being directly overhead, it is also as close as it is going to get, i.e. minimal path loss, so you don't need as much gain. So as Gary suggests, an antenna with a closer to the horizon pattern where you need the gain is a better bet.

:
Sorry, Zack, but I have to agree with Gary. In my experience working RS-10 over the past few years, a simple vertical antenna works best. I use a home-brew 5/8 J-pole most of the time, with 10-30 watts. On really bad passes (close to the horizon) I switch over to a 5 element beam aimed at the horizon. In the 50+ contacts made, I've experienced a high angle dropout once or twice, when the satellite was *right* overhead (89.something degrees). Those happen very rarely, and the dropout lasted less than a minute.

The problem with working satellites is that they're like the proverbial potato chips - once you've worked them you're hooked! The best advice is to get a setup which will maximize longer term enjoyment of this aspect of the hobby.

Now, for the original question - I believe I read in SpaceNews that MIR has had some power supply problems recently. There was a statement that one of the inhabitants was only on the air occasionally over Europe, which I extrapolate to there not being any ham activity over the rest of the planet. Your antenna and radio may be working just fine, but it takes two for a QSO. Be patient; they'll get things working again on their end. In the mean time, you might try some of the other Low Earth Orbit satellites - RS-10 or AO-27 would be good candidates (for phone; I'm not up on packet sats yet).

> satelites. Use an out door antenna though.

The second one should read 137.500 MHz.....

One other thing that you will have to keep in mind. The IF bandpass
of most scanners is too narrow (15 KHz?) for NOAA APT work. You need
about 40 KHz to get the best results. This is because the signals are
modulated to about +/- 17 KHz.....add a few KHz for doppler.....

> 2) When you receve a good sig, get the program JVFAX, ver. 7,
> and a faxconverter. (there are some vy simple designs around,
> also for the WX sats, the JVFAX manual might help).

Yup....look for the AM demodulator part.....

Another excellent publication to consider is:

WeatherSat Ink
c/o Bluebird Greenhouses
4821 Jessie Dr.
Apex, N.C. 27502

Published quarterly on each solstice or equinox, $18 yearly.

Multifax 6.0 software/hardware, modified Bearcat 145 or equivalent scanner, must have at least 50khz bandwidth for full 256 grey-scale capability. I use a steerable cross-yagic with "Hamtronics" preamp.--The Multifax demodulator hardware is also GOES WEFAX capable.

: :
: Sorry, Zack, but I have to agree with Gary. In my experience working RS-10
: over the past few years, a simple vertical antenna works best. I use a
: home-brew 5/8 J-pole most of the time, with 10-30 watts. On really bad
: passes (close to the horizon) I switch over to a 5 element beam aimed at
: the horizon. In the 50+ contacts made, I've experienced a high angle dropout
: once or twice, when the satellite was *right* overhead (89.something degrees).
: Those happen very rarely, and the dropout lasted less than a minute.
: good candidates (for phone; I'm not up on packet sats yet).

According to my calculations, the minimum you need to work MIR
(height nominally 400 km) is 10 milliwatts to an antenna with 0
dBi gain straight up. I made the assumption that the astronaut
isn't an FM DXer, and isn't used to pulling weak FM signals out
of the noise (-118 dBm needed for a good signal)

Due to the increase in path loss, you need at least 15 dB more
signal when MIR is at the horizon. This assumes that you have
a clear horizon. When MIR is 8 degrees above the horizon, you
still need 11 dB more signal than when it is overhead.

Now, what does this mean in practical terms, since most people
run more than 10 milliwatts? It just means that you probably
have a 10 dB or so advantage if you are located in a good spot
as opposed to someone on the edge of the footprint. This is where
MIR is fundamentally different from RS-10. With RS-10, you can
still work people if you are 10 dB weaker than the strongest
stations. Signals 10 dB weaker in an FM receiver get covered up
completely.

A statistical analysis of possible MIR paths doesn't make
sense to me. If I wanted to work MIR I would look at the
actual paths and choose the best ones. Then I would make sure
my antenna and location was appropriate for the path. The
statistical analysis that might be useful is to analyze the
locations of stations that have worked people in space, to
see what places seem to have the edge.

If I was really serious I might even alter my travel plans
a little to give myself a better chance. After all,
traveling hundreds or thousands of miles for business

or vacation isn't unusual anymore. Personally, I'd rather
vacation in Hawaii than in New York City, even though it
is a longer trip that makes carrying a carload of stuff
difficult. Carrying something along to work MIR ought
to be easy compared to bringing something to worth through
Oscar 13.

1795. Wanted: Info on geeking at sea via satellite

Newsgroup: rec.radio.amateur.space
Date: 1994-11-03 18:43:34 UTC
From: hermit@cats.UCSC.EDU
Message-ID: <HERMIT.94Nov3104334@am.ucsc.edu>
Source record: 26418

We purchased a sailboat recently and plan to do some medium to long range cruising and would like to know if there's any way we can stay in touch with Usenet while we're gone.

I'm not currently a Ham but have been seriously considering it, and am not afraid of Morse Code.. I learned it in the Scouts but forgot it since then. So I'm willing to go pretty far to get licensed for this if necessary and am curious about serious amateur radio as a way of keeping in tocuh with the world while at sea. Are there any ways to get email and/or news via satellite while at sea? And the more difficult question (I would think) is how can I send back my replies?

I posted on rec.boats and it was suggested that I ask here. I'll try to keep an eye on the group for a response, but I would appreciate responses sent via email in addition to posting here in case it expires before I see it.

Thanks a lot for any help you may be able to provide!

That's a pretty good assumption. That's a 0.28 microvolt signal at
the MIR crew's Japanese transceiver, assuming their external "vertical"
antenna's gain equals out with their feedline loss. (I don't have exact
figures on those two items.) That should give them something on the
order of 12 db of quieting in their receiver for a 10 mW uplink ERP.
Just 3 db more signal would give over 20 db of quieting thanks to the
FM effect. So an uplink ERP of 20 mW should deliver armchair copy for
the overhead pass.

>Due to the increase in path loss, you need at least 15 dB more
>signal when MIR is at the horizon. This assumes that you have
>a clear horizon. When MIR is 8 degrees above the horizon, you
>still need 11 dB more signal than when it is overhead.

So you'd need about 1.26 watts ERP at the horizon, or about 0.5 watt
ERP at 8 degrees elevation to deliver a 20 db+ quieting signal to
MIR. If our poster had a typical 4 watt HT (he doesn't, he has a
10 watt rig at a fixed station due to license restrictions), then
he'd have plenty of signal margin down to the horizon *if he weren't
penalized by an antenna putting a null at the horizon*.

>Now, what does this mean in practical terms, since most people
>run more than 10 milliwatts? It just means that you probably

>completely.

But since our poster has a radio delivering 30 db more power than
you postulate, he can easily put a full quieting signal to the
horizon if he isn't penalized by a poor antenna choice. It's certainly
true that FM capture means that stations only 3 db stronger will
take over the receiver on MIR, but this isn't a power war DXer pileup
we're talking about. From his location, our questioner is going to
be nearly the only station in the footprint. If there *are* others,
they can take turns in an orderly manner *if their window is large
enough*. It won't be if they can only use the very few moments of
the overhead pass. If they can use the full 12 minutes of visibilty
available to them, their chances of a contact improve greatly.

>A statistical analysis of possible MIR paths doesn't make
>sense to me. If I wanted to work MIR I would look at the

>see what places seem to have the edge.

The problem with that idea is that MIR, and SAREX, operating
schedules are erratic and not under your control, while the
laws of celestial mechanics are fixed, and also not under your
control. You don't know that they will be operating during the
two minutes of the sole overhead pass you can reach on any given
day, or that you could win a power war with a station with thousands
of watts ERP if they were operating at that moment. You've got at
least six passes each day where you'll be in the footprint, for at
least 12 minutes in one case, if you can access them when they are
less than 30 degrees above the horizon. So your window of opportunity
for catching them on the air, and not being monopolized by an alligator,
is much larger if you don't concentrate on just the overhead pass.

>If I was really serious I might even alter my travel plans
>a little to give myself a better chance. After all,
>traveling hundreds or thousands of miles for business

>to be easy compared to bringing something to worth through
>Oscar 13.

Well with current MIR operating habits you'd have to travel
to Europe, and compete with the guys with thousands of watts
ERP, since that's the only time MIR is currently operational
due to their power problems. That's supposed to be fixed soon,
and we should be able to go back to having leisurely QSOs
with the cosmonauts any time they are above our local horizon.
It normally helps if you speak fluent Russian, though right
now you'd do better to speak German. The cosmonauts typically
aren't DXers, and like to chat, if you speak their language.

With their aviation English, hello-goodbye type contacts are
all you can expect if you don't speak their language. Remember
the amateur radio gear is on MIR for *their* recreation, not
your award chasing. Respect that.

Gary

1799. ANS-Bulletins and Kepler elements in this news group?

Newsgroup: rec.radio.amateur.space
Date: 1994-11-04 10:07:22 UTC
From: Huub van Thienen <huub@cs.kun.nl>
Message-ID: <CyqMsB.ELF@sci.kun.nl>
Source record: 26547

When I began following this news group (about three months ago), there was a regular supply of AMSAT News Service Bulletins. However, I have not seen any for the last six weeks (the last one I received was sent on september 17). This is a bit dissapointing, as I appreciated these bulletins very much.

I can think of several explanations for this. Perhaps no bulletins have been posted to this news group since mid september, because there was no news concerning the birds circling around us. This is quite unlikely. Another explanation is that there is a regular stream of Bulletins coming out of AMSAT Head Quarters, but somehow none of these bulletins make their way to my site. This is much more likely, but frightening at the same time. If there are messages lost at some point, there must be much more that I am missing, of which I am even not aware. Finally, AMSAT may have limited the distribution of their bulletins to a part of the world in which I do not live (I am in the Netherlands). If this is the case, I would like to know an address of someone who is able to change this. Perhaps I can contact them and try to persuade them to include nl in their distribution.

A similar thing holds for orbital data. I have not seen Keplerian element sets since october 6. This information is perhaps even more valuable than the ANS bulletins, so I would like to see them here again too.

So, I would be grateful if someone could give me some information about the possible reasons for not seeing this vital information anymore.

Regards,
Huub van Thienen

Greetings All, I've always wanted to get involved in Amateur satelites , but the cost has always deterred me. However i've seen designs in ARRL H/book for "turnstile" antenna's. This would allow me to "get my feet wet" , but here's the question : Is there anyone out there ACTUALLY using such antenna's ? if so , could you please advice of their usefullness I don't have unrealistic expectations, I realise they won't perform like a yagi etc. but do they work , and what "birds' would I be best advised to use them on. I already have 2 metre SSb , no 70 cms yet , but if I saved on antenna's at the outset ..well 70 cms is a possibilty in near future. I'm only new on the "net" , so suppose these kind os postings may be common, so sorry 'bout that :-) , but thanks in advance to anyone who can give me the benefit of their experience. de vk4xd. vk4xd@vk4wia.bne.qld.aus.oc or Email plove@enterprise.powerup.com.au

There isn't an Amateur link via satellite to the Net. There are, however, many satellites that do data. Maybe someone at home can do the forwarding between for you.

I am in the middle of setting up a satellite link for my Catalina 30. I will be taking it to Hawaii next year, so it may take a while. I am on very new ground with this project!

BTW, the license to get on satellites (Technician) no longer requires Morse. The ones for HF still do, however.

Have fun!

I have had exactly the same thoughts. There are some upper-ups who continually block this idea, however. The main objection is that countries outside the USA will not support Geo orbit sats. Presumably, they say this because they beleive that they would not be able to use it. This is extremely shortsighted, however.

As you mentioned, it would be possible for 3 birds to see 90% of the globe, so it would be a truly international project. I beleive that there are some other motivations for not supporting this idea, but there is a chance.

After Phase 3D, where do we go? The president of Amsat mentioned a Geo sat, though with the above objection. Maybe we could convince others that it would be a good idea? The elliptic sats were good, but it is time to get into the present with some Geo sats. This not, actually, a new idea. Arthur C. Clarke, in his original postulation about Geos, proposed three sats spaced around the globe and linked together.

I will probably be writing a piece for the Amsat Journal or ANS very soon, so I won't use up any more disk space here. Keep the faith!

See-Ya-Bye

1803. Ham Satellite

Newsgroup: rec.radio.amateur.space
Date: 1994-11-04 17:54:55 UTC
From: jho@xilinx.COM
Message-ID: <199411041754.AA12059@clemenza.xilinx.com>
Source record: 26549

Hi there,

I'd like to share some of the thought with you guys on the net about the
futhre ham satellites. I always hear from satellite hams say that LEO sat
is easy to work and is good for a short contact. OSCAR-13 is good for DX and
long QSO and
however, it is not easy to work (expensive equipment and tracking etc) and
signal is always weak.

Since there are a lot of commerical geostationary
satellites on the orbits, is it possible that we hams can build reasonable
ERP small size transponders placing in the commericial satellites to share
some common facilities such as solar panels on the commercial sat platforms?
If this can be done, several ham sats can be linked so that a reliable world wide
ham sat network can be formed.

73,

JOnathan

Just bought a new Yeasu FT-5200 (dualbander 2m/440 fm).
Bought it with the intention of getting into pacsat, but I am
quickly finding out that I don't have the proper equipment.
I have the following:

FT-5200
IBM PS2 L40 laptop (386)
KPC-3
Instatrak
Using Procomm+ for windows for comms

1. What else do I need?

2. Are there FM only satellites using 2m/440?

3. Any helpful tips?

Thanks.

Message-Id: <tkelso.783989783@eel>

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Good idea, unfortunately the commercial geosat boys aren't interested
in letting us piggyback, and when AMSAT finally figured out what our
own geosat would cost, the gasp could be heard around the world. :-)
Looks like ham geosats will have to wait a while longer.

Gary

I never have figured out where all the rumors about satellite work being
expensive come from. Probably something to do with ad dollars. :-)
I've made satellite contacts using about $300 worth of equipment.

>However i've seen designs in ARRL
>H/book for "turnstile" antenna's. This would allow me to "get my feet wet"

>antenna's ?

Yup, I am. The Handbook doesn't give much advice about how to support
one of those critters, though. I use a 2'x2' piece of plywood for a base,
with L-brackets underneath to attach it to a 2x4. The elements are plain
copper wire, supported by cane poles (looks like bamboo). I coated the
cane & plywood with spar varnish, and it's held up well for three years
now. (This is a 10-meter antenna, by the way, for Mode A downlinks.)

Performance depends largely on how far above ground you mount it. From
the charts in the handbook, 3/8 wavelength is about ideal for satellite
work.

This kind of antenna is best for low-orbit satellites, namely RS-10 and
RS-12. SEDSAT will be going up in 1996, and it'll work there too.

> Dave Donovan
> ddonovan@mayo.edu

Besides AO-27, already mentioned, try Dove on 145.825 MHz. Dove is currently sending a digitally synthesized voice saying, "Hi, this is Dove in space." and audio tones. It's also sending greetings and telemetry using standard 1200 baud packet. (And your HT can drive a standard packet TNC to display it.)

Mir and the Space Shuttle use 145.55. The next shuttle flight with amateur radio on it is in Feburary. Mir is having power problems, but the German guest astronaut was QSOing on 145.55 last week. I think he returned to earth yesterday, though.

Haf fun,
Dave, N9LTD

1810. WISP with KCT ??

Thank you for your reply. However, I get the feeling that I have to join AMSAT to be able to get this.....I don't really want to !!

Can I just get the software WITHOUT having to be a member ??

If it turns out that I have to join, what does membership "get" me (besides the stuff I'm after in the first place).....I'm not a Ham radio operator, so I don't have any real interest in those satellites. It also seems that it's a bit pricey.....somewhere I heard $80 US (or was that membership plus software ?).....is this a one-time fee, or is this the annual fee ?? If the latter, I had better have a darned good reason to pay that much for membership in a "club"......

Am I kornfused yet ?? :-))

>2. Are there FM only satellites using 2m/440?

Jeffery, I'm new to the group here and new to Delphi, but I thought I could get at least a partial answer to your posting. To answer your question, yes, there are several FM satellites available for digital use.I am looking at a list put out by AMSAT.
They list UO-22, KO-23 and KO-25 as primary FM digital birds. They all run 9600 baud however and unless your radio is already wired for it internally modifications are required along with a suitable 9600 baud modem add-on to your TNC. They also require specialized software to communicate. Also, check the frequency range of your rig, the downlink for these birds is from 436.5Mhz down to 435.12Mhz your radio might not cover these.
A wealth of beginner info on the pacsats is available from AMSAT.
"The Pacsat Beginner's Guide" call AMSAT 301-608-3410. They are a non-profit international club and would be happy to help.

All versions should support the KCT/T. I have been running this combo for a long time.

For the newest version of satelite.drv, you can ftp from me at:

ftp.teleport.com/pub/users/n7ryw

I will put it there as a seperate file as soon as I am done with this. You may want to update other Wisp files, too, as I suspect you have a very old version. Tell me which versions you have first, as there are some other things that need to be done depending on the versions you have.

You can find this info from GSC in the Help...About box. Be sure to write down all of the program names and versions.

Mail the info to me at n7ryw@teleport.com

Hello all,

Our middle school (grades 6-8) is in the process of writing a proposal for a SAREX contact with a future shuttle mission.

We have the necessary equipment & expertise available, as well as plenty of contacts with news media, so those parts of our proposal will be relatively easy to address.

I am working with the 6th & 7th grade science teachers, and principal to define how we will integrate aspects of amateur radio, and space science into the curriculum.

Has anyone here submitted a successful SAREX proposal? We already have fairly definite ideas on how we want to implement SAREX project at our school, but any contructive ideas on what 'works' and 'doesn't work' with middle school age kids would be useful to us. It would also help us know what the SAREX 'powers that be' would feel is important and non-important.

My EMail address is :

william@cortex.ama.ttuhsc.edu

Thanks,
William Biggs

OK, here's a wild idea for people to consider:

I know amateur radio enthusiasts can bounce signals off
the moon with fairly modest antennas (meaning antennas that can fit
in a North American's back yard), and get enough gain that they
can *talk* real time to each other that way. Thus the signal to noise
ratio must not be too bad.

In Geophysics there is an entire science built around using
weak sources to explore. For example, "vibroseis" which has replaced
dynamite as a seismic source for many purposes. Basically you get a
big metal plate attached to a heavy truck and shake it up and down. It
doesn't put out nearly as much of an impulse as dynamite does, but
that's OK, because you can keep wiggling it for 30 seconds or even
longer, with a known waveform. (Vibroseis was originally invented
to allow recording in places like urban Los Angeles, where dynamite
could not be used for obvious reasons.) The vibroseis waveform is
designed to crosscorrelate with itself into a nice spike. (Most people
use frequency sweeps, but others have used "Guassian noise" with some
success as well.) When you crosscorrelate the recorded "noise" with the
source waveform, magically a seismic section appears that is nearly the
same as could have been recorded with dynamite. In fact, it can be better
because you can tune the vibroseis waveform to put more energy in
frequency bands where you need it.

Vibroseis is old hat these days. More recently, some outfits
have begun to use the thumping sounds a drill bit makes while a hole
is being dug as a seismic source. The signal to noise ratio in that case
is just atrocious, but since the drill bit keeps thumping along for a
looooooonnnng time and you can record the thumps as it makes them, you
can generate a seismic section from such data too if you're willing to
cross-correlate with enough "noise".

This got some of us thinking... if an amateur can *TALK*
real time bouncing signals off the moon, how big an antenna would you
need to look for near-Earth asteroids, if you were willing to broadcast
for hours or days at a time and cross correlate with a looooonnnnnggg
source waveform? It seems to me some of the same sort of equipment
developed for SETI might be able to do this. With the plummeting price
of computer power and memory, would such an experiment be within an
amateur radio astronomer's reach?

Would there be some equivalent of the passive seismic experiments
as well? What about using the Sun's or Jupiter's radio emissions as the
cosmic equivalent of a thumping drill bit? Or some manmade broadcast, like

a military early-warning radar?

Two way data via Inmarsat is *very* expensive. We are talking around $/KB
ratios. There is a company that do broadcast UseNet (at 1200bps compressed)
via satellite but I can't remember their name :-(. They do have a couple of
newsgroups though if you fancy a trawl through the big list.

> ham sat network can be formed.

Geosat builders charge BIG $$$$$$ for even small loads. And they don't like
amateur built (even if some of us are professionals for our day jobs)
electronics and antennae aboard. They also like to squeeze every mW of power
from the solar cells. Don't forget there arebig dB losses at the geostationary
distances and power levels we can use without big dishes. I think a nest of 3
geosats would get very boring very quickly. Amateur radio is all about
pushing the boundaries a bit. I would rather see a lunar orbit/lander or a
Mars probe (like was mooted for the core of P3D).

Mike.

It's not that good unless at least one of the stations involved is
a "super" station. Usually, moonbouncers are excited to get a few
long dashes back off the moon. The path loss is really large, on
the order of 240-270 db depending on a variety of factors.

This technique can be used on radio paths too. The Lowfer's, a group
of experimenters running low power radio in the 160-190 kHz band,
use a long term correlation technique to synthesize extremely narrow
filters. This allows them to get remarkable results with signals that
are well below the nominal noise floor of any conventional receiver.
The key to making this work is to know precisely the characteristics
and timing of the signal to be received. A single bit time may be
10 seconds or more, and each station uses a precise time reference
that is closely synchronized with the other station's reference.
This technique should be usable for moonbounce too, with allowances
made for doppler and libration.

>amateur radio astronomer's reach?

I think the main problem would be the unknown doppler of the target.
Since the return echo will be frequency shifted an unknown, and
varying, amount, the correlator will be continually slipping phase.
There will be at least three sources of doppler. One will be due to
the rotation of the Earth, one due to the intrinsic velocity vector
of the target asteroid, and the final one due to the different
heliocentric velocities of both bodies. In principle, the first can
be compensated a priori, and the third can be controlled by looking
at only certain orbital volumes at any given time. The intrinsic
velocity for an unknown eccentric asteroid is going to be difficult to
deal with satisfactorily.

> Would there be some equivalent of the passive seismic experiments
>as well? What about using the Sun's or Jupiter's radio emissions as the

>a military early-warning radar?

That's an interesting idea. You need a precisely determinable source
in order for the correlator to lock phase. I'm not sure the Sun or Jupiter
would fit the criteria. Certainly, however, UHF TV sync signals would
do as a strong source. They are in the range of 5 million watts ERP,
and would paint the near horizon sky in a sweep controlled by the
Earth's rotation. Unfortunately, because there are several such
transmitters sharing the same frequency in the same hemisphere,
they are not precisely locked together, and TV sync signals are of
short duration (though precisely repetitive), there could be problems.
They'd be much more tractable than military radars, however.

A quick feasibility check would be to have an active moonbouncer
see if they can detect UHF TV sync pulses off the Moon without
special correlation. If they can, then using a correlator should
enhance the signals markedly. Obvious note: the TV station should
be over the moonbouncer's local horizon, else the direct signal would
dominate. A station that is also on satellite so timing correlation
is easily achieved for the sync pulses would be desirable. I'd
suggest WTBS Ch 17 in Atlanta as a possible source for experimenters.

Gary

>Subject: Freqs to hear NASA commentary?

There have been many requests for "where do I find the audio for the Shuttle" on the forum. As mentioned earlier, the Goddard Amateur Radio Club (Greenbelt, MD) re-transmits the audio on a number of HF frequencies, and a number of Amateur Radio repeaters throughout North America also place the Shuttle audio on their output. This system is called "NASA Select Audio", and is usually pulled from a satellite feed or other direct method. This service is available on non-DoD missions. On some launches a video feed is also available, which is then made available on some ATV (Amateur Television) repeaters.

I have summarized those feeds that I know about below, I would encourage you to let me know of any additions or changes that you know about. Keep in mind the list will change as repeaters add or drop the audio. Also, the audio will be present only when there is activity, which is not constant, especially at night. At other times you will probably hear other Hams chatting.

1827. AO-27's Back!

Newsgroup: rec.radio.amateur.space
Date: 1994-11-07 18:23:07 UTC
From: greg@core.rose.hp.com
Message-ID: <CywtqJ.KKz@icon.rose.hp.com>
Source record: 26414

Well, it seems that AO-27 is back in the analog FM Repeater mode. I worked VE7VVW Ron (*) on Saturday afternoon; he had a really nice signal, subject to the characteristic AO-27 fade. "The Fade" is possibly my problem in not having a circular antenna, but the effect is that a signal will be Q9 one minute, and inaudible the next.

Having said that, I wasn't able to hear the bird on Sunday, so maybe it's schedule is still somewhat erratic.

Greg KD6KGW

(*) I've heard Ron for some time on several satellites, but it wasn't until Saturday that I understood he was Ron in Vernon, BC, instead of Vern in BC. :-)

1828. Where to get MacSat?

Newsgroup: rec.radio.amateur.space
Date: 1994-11-07 19:30:23 UTC
From: tkreyche@zdlabs.ziff.com
Message-ID: <tkreyche-071194113023@tomkreyche.zdlabs.ziff.com>
Source record: 26431

I've looked all over the net and called Celestial BBS and can't find MacSat. Does anyone know where to get it? Also, the apple ftp site for ham radio is completely empty! What's the deal?

Thanks, Tom KG6YJ

1829. Q: MIR, current callsign?

1830. Anyone receiving NOAA weather satellite transmissions

Newsgroup: rec.radio.amateur.space
Date: 1994-11-07 21:21:52 UTC
From: drangmei@ll.mit.edu
Message-ID: <1994Nov7.212156.13840@ll.mit.edu>
Source record: 26433

I am looking to build a image display section for NOAA APT format images.
Unfortunately, I don't currently have a receiver capable of aquiring the
satellite transmission (although I hope to get one in the not to distant
future).
In the mean time, I would love to get my hands on an audio cassette recording
of the 2400 Hz AM tone from a few satellite passes so that I can start working
on an image display unit.
If anyone is interested in helping me out it would be very much appreciated.
I would of course supply the cassette and pay postage to and from anywhere in
the US.

Thanx,
Rick D.

Radio Meteor Observation Bulletin No. 15 November 1994

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: M. De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.17 MHz
Transmitter Locations:
Katowice, PR3, Poland, 65.99 MHz, 14 kW, Distance 1100 km
P. Neant, PR3, Romania, 66.17 MHz, 40 kW, Distance 1400 km
Czestochowa, PR3, Poland, 66.23 MHz, 20 kW, Distance 1080 km
Gdansk, PR3, Poland, 66.29 MHz, 40 kW, Distance 1100 km

Antenna: crossed Yagi, 4 elements, Azimuth 270 o (=East), elevation 30 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava
Sensitivity: 8 muV for S/N = 26 dB (300 Ohm)
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored on file
in the University of Ghent format (Prometeos), and are available for
further analysis. Reduction software for DOS and Windows available].

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. change in hardware setup on Oct 3 (a dedicated PC-AT is now in place).

. % : transmitter outage during the whole hour or a part of it. Low counts indicate that no other interference, which could be confused with meteors, is picked up.
Few transmitters are broadcasting between 2h-4h local time (Sat-Sun 3h-5h local time) or sometimes longer. (When winter hour is in use: local time = UT + 1h).
The switch to winter hour took place during the night of Sept 24-25.

. & : manually eliminated for direct reception.

* strong activity can be noticed on 22 Oct 3h - 6h UT and 23 Oct 5h - 6h UT. The Orionid radiant rises at 20h30m, and sets at 11h15m. Best forward scatter conditions for this setup around 5h - 7h UT.

M. De Meyere / C. Steyaert

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

1832. Balloon pressure transducers

Newsgroup: rec.radio.amateur.space
Date: 1994-11-07 23:14:34 UTC
From: "Theresa T." <mhaskins@facstaff.wisc.edu>
Message-ID: <39mccq$cru@news.doit.wisc.edu>
Source record: 26434

Last week someone posted a message, since scrolled off my system, asking about pressure transducers for a high school balloon project. I've just found a great source for a cheap, high quality transducer.

The Transducer:Microswitch 142PC15A

It's a plastic box the size of two dominos with two nipples (one blocked off) and three pins. The pins are +, GND and OUT.

The output is a voltage that increases linearly from 1 to 5 volts as the pressure varies from 0 to 15 pounds. It's temperature compensated.

A friend, WB9YHB, found these in an old catalog for $84.00 each. However, a surplus place in Dayton sells them for $2.95! And if you order ten or more, that drops to $2.50!

The company is:

MECI (Mendelson Electronics Co. Inc)

Their phone is 1-800-344-4465 Voice 9a-6p EST Mon-Fri
1-800-344-6324 Fax 24 hours

The MECI part number is 540-6206F and it's on page 9 of their catalog.

Unfortunately, they have a $20.00 minimum order, so get ten of them!

Cross-posted to: rec.video.satellite,rec.radio.amateur.space,rec.photo,sci.image.processing

I want to know where I can order a satellite photo of
a city in Siberia (Krasnoyarsk).

Sorry for the cross posting, I picked groups where readers
might have the knowledge.

Years ago I ordered a photo of US city through the mail.
I can't remember who I ordered it through, and I believe
the organization changed its mission later anyway.

Any help appreciated.
Email is fine for replies.

>H/book for "turnstile" antenna's. This would allow me to "get my feet wet"
>, but here's the question : Is there anyone out there ACTUALLY using such
>antenna's ?

I used one for many years, while I was in an apartment, and I had very good
results. Pay close attention to the spacing between the elements and the
ground. This has a big effect on the pattern. For a non-rotated antenna, I
think 3/8 wave spacing was good.

To be able to transmit, be careful with the
phasing line used. A simple 1/4 wave on one dipole is fine for receiving, but
gives a higher SWR on TX. I can send you a drawing of a good feed setup, or
you can try trimming the elements to get it down.

I mentioned this antenna once before here, and it was clear to me that many
did not understand it, so be careful of misinformation!

See-Ya-Bye!

You can try SPOT Image at 703-620-2200 (10 meter resolution). A cheaper source may be Russian imagery. I know that TRW is selling those. A contact in TRW in California is Liz Greenberg - product manager. I dont have her ph number

Jonathan Ho (jho@xilinx.COM) wrote:
: Hi there,

: I'd like to share some of the thought with you guys on the net about the
: futhre ham satellites. I always hear from satellite hams say that LEO sat
: is easy to work and is good for a short contact. OSCAR-13 is good for DX and
: long QSO and
: however, it is not easy to work (expensive equipment and tracking etc) and
: signal is always weak.

: Since there are a lot of commerical geostationary
: satellites on the orbits, is it possible that we hams can build reasonable
: ERP small size transponders placing in the commericial satellites to share
: some common facilities such as solar panels on the commercial sat platforms?
: If this can be done, several ham sats can be linked so that a reliable world wide
: ham sat network can be formed.

The signal are weak because of distance. A LEO at 500 miles is 32 dB
stronger because of the inverse square law. You can compensate for this
with spot beams, if you don't mind sacrificing coverage. But, if you
have to cover the entire earth, you are limited to roughly 20 dBi gain.
Thus, you need lots of watts (many solar panels) to get the ERP up so that
people on the ground can use small VHF antennas for receive.

Or, you could use a little dish with a preamp at the feed for 2.4 GHz.
The sky noise is much quieter at microwaves.

(BTW, 32 dB is the difference between a legal limit station in the USA and
a 1 watt QRP station--people spend lots of $$ to achieve this--many radios
would be cheaper if everyone were satisfied with 1 watt)

But, this doesn't quite solve the uplink problem--how people will
access the satellite with small antennas and low power. The
satellite receiver is hampered by the warm Earth (ground stations
get to look at cold sky), so the trick of going to a quiet
microwave band doesn't quite work.

I don't know about Amsat US, but Amsat-UKs subscription is about 15 gbp
a year. This gets you 6 copies of Oscar News. What is left (very little) goes
to the new satellite fund. Despite being a licensed amateur, I have never
transmitted through the birds but feel that nevertheless it is only right
that I contribute to the facilities I use.

Mike.

To give a feel for that, we use 3 meter dishes and 400 watt TWT
amps at Ku Band to just get a sparklie free video picture on a
GE K2 transponder (the most senstive in our footprint). That's
a hell of an ERP for most amateurs to think about generating.

1842. November 12th balloon flight

Newsgroup: rec.radio.amateur.space
Date: 1994-11-08 23:00:28 UTC
From: djs19@ksu.ksu.edu
Message-ID: <39ovuc$h8q@matt.ksu.ksu.edu>
Source record: 26450

The SSOK (Sky Science Over Kansas) group is planning a high altitude balloon launch the weekend of November 12th with a backup date of November 13th.

This is a continuing series of helium balloon flights carrying a GPS receiver with the goal of reaching over 125,000 feet. With the use of GPS data an altitude can be verified within several hundred feet and used as a benchmark for future flights by amateur balloonists.

With an altitude of 125k feet, radio range should be near 500 miles for stations using beam antennas. We encourage all stations to send reports either by the 40 meter net or by the return address given below. Indicate when you FIRST hear the signal. Please give UTC time and your location in latitude and longitude or by grid square to 6 places. Please note the type of receiving system you are using at this time, i.e. narrow band (cw/ssb) or FM. Also send in the first complete packet line received, this will have the UTC time with it. With this information we will compare the calculated difference between the optical and radio range and study the signal propagation at different receiving points.

Flight information:

Launch date: November 12, 1994 Backup on the 13th
Time: 1500 UTC, (9am cst)
Place: Salina, Ks 97,46,43W 38,49,33N

Package information:

Downlink frequency: 144.340 Will transmit every 10 seconds
Mode: Packet GPS data, (GGA line)
Beacon#1: 147.310 <5mw
Beacon#2: 28.322 5mw

Net control:

Low band 40 meters: 7.155 Will have latest status starting at 1400 UTC
Call WB0DRL
Send reports to:

WB0DRL, callbook address
e-mail to <djs19@ksu.ksu.edu>

Hi Bill,
If you need new keps for tracking, they can be had for free and here is how....send an email to the Dallas Radio Imaging Group with nothing in the body, in other words just the address (weathkep@drig.com) and you will automaticly receive via email, keps on all weather sats.

additional info= elements@drig.com gets you all elements you want
amsatkep@drig.com gets you amsat format elements
(amateur sats only)
shuttle@drig.com gets you shuttle elements when avlb.
weathkep@drig.com gets weather sat elements
info@drig.com gets infomation on how to etc.

Well, hope this helps you and good luck with the birds.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1845. Proper way to call Mir / Shuttle help needed

Newsgroup: rec.radio.amateur.space
Date: 1994-11-09 01:15:04 UTC
From: tomsunman@aol.com
Message-ID: <39p7qo$gip@newsbf01.news.aol.com>
Source record: 26445

Hello. I'm a new ham and I'm VERY interested in trying to contact
Mir and the shuttle (when sarex is used of coarse!).
My question is, what is the PROPER procedure for calling these craft? Is
it a regular call (their callsign then "this is" my callsign)? Maybe
"shuttle atlantis" (or whichever) "this is my callsign"? I want to make
sure I do it properly.
I have an HT and I understand they can work but I may need higher
power and a better antenna to increase my chances. I know the uplink is
145.550, I suppose I need to switch to the downlink after I make my call
to hear their responce. What is the downlink frequency? Any help on
getting me started on these contacts would be appreciated. My license
should be here in about 5 weeks so I've got some time to learn what I need
to know. Thanks!

For the shuttle, the DOWNLINK is 145.550. The UPLINKS for voice are 144.91,
144.93, 144.95, 144.97, 144.99. The uplinks are random so just pick one.

Mir transmits simplex on 145.550.

Hello Tom,

Try,

ftp.demon.co.uk /pub/ham/mac

you find about 10 meg compressed Mac ham programmes in there including SatTrack, Orbitrack and MacSPOC.

Any problems or if you need any more info please let me know.

Regards,

Sean.

1848. satellite situation reports, where can I get them?

Newsgroup: rec.radio.amateur.space
Date: 1994-11-09 15:02:00 UTC
From: mora@bb.fido.de
Message-ID: <b24510e0%fidonet@p41.f106.n6000.z242.fidonet.org>
Source record: 26449

Hello!

I'm searching the 'Satellite Situation Report' from NASA as an ASCII-file.

Sombody explained me how to connect the RAID.BBS via a telnet session
at raidbbs.gsfc.nasa.gov, where this files should be stored for download.
When I logged in, a message appeared, that the BBS has moved to
olg1.gsfc.nasa.gov.

But the old password doesn't work. And Anon-FTP seems to be not allowed
on this site.

Does anybody know, here I can ftp the satsit*.rpt-files or how I can
log-in as 'guest' at OLG1?

Any hints would be great!

This is what I found for MacSat Tom: It's apparently available on at least two
servers on the internet.

archie.au 139.130.23.2 in the /pub/ciac/macutils directory
filename: macsat.sit
and
ra.nrl.navy.mil 128.60.0.21 in the /MacSciTech/astro directory
filename: macsat-11.hqx

Hope this gets you on your way.

Hi Zick,

Probably you have the "first hand" information about feasibility to use
comsat, metrosat, DOD sat platforms to peggyback hamsats. I bring this up
simply because, I think, this is easier to achieve than build an brand new
phane 3D for satellite Dxing. What do you think?

From: rargyle@cc.weber.edu
Message-ID: <9NOV199412011519@cc.weber.edu>
Source record: 26457

For a LEO satellite now in the design stage, we will have a 307.2 kbaud digital downlink in a 100 kHz (or less?) channel. Could someone point me to sources of an S-band radio capable of being computer tuned over the > 100 Khz doppler shift, with adequate bandwidth?

Is it possible to modify the PacComm Tiny-2 (or other TNC) for this baudrate?

We will have two downlinks, S-band and UHF. What modification to the Kansas City Tracker/Tuner hardware and software will be needed to simultaneously control radios in two bands?

One possibility is to downconvert the S-band to (say) VHF, and use a separate KCT/T and computer; has anyone experience using KCT/T, or a Trackbox, etc., with downconverted tuning?

Please reply by e-mail
73, and thank you,

I have been beta testing the DSP-93 for several months. I have used it on 9600 bps satellites and 1200 bps terrestrial packet. Others in the group have used it with the PSK birds and HF "packet".

Performance is equal or better than the DSP-2232 in my case. I use it with an IC-970.

For Shuttle, just say the phonetics of your callsign. For istance, Kilo Delta Victor Yanke Victor for me KD6VYV. If they hear you they will repeat your callsign and give you a reference number. They change channels between the four randomly. So you wont know what channel they are listening to even though you hear them on 145.550! They do this to get rid of the huge pileups they would get if everyone was trying to transmit on the same freq. Good luck,
Walt

1860. HF-UHF Transverter info

Newsgroup: rec.radio.amateur.space
Date: 1994-11-10 23:34:33 UTC
From: beau@enterprise.america.com
Message-ID: <39uam9$5l7@enterprise.america.com>
Source record: 26461

I have a Kenwood TS-430S HF tranceiver. I would like information on
the X-verter output of this radio. I plan on hooking it up to a
Down East Microwave DEM432-15S Transverter. I am looking for the
output power of the Kenwood thru the x-verter port and the compatability
between the transverter and the Kenwood.

specs on the transverter:

input 1mw max @28Mhz

The transverter currently covers two segments of the 70cm band,
432-434 and 435-437Mhz. I would like to modify the the transverter
to cover 444-446Mhz instead of the 435-437Mhz sector. Any info on
this conversion would be appreciated.

I would also like any comments on the operation of this transverter by
anyone who has operated one.

Message-Id: <tkelso.784522839@eel>

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, *(205) 409-9280*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

From: bbs@kd3bj.ampr.org
Message-ID: <Cz343J.n4y@kd3bj.ampr.org>
Source record: 26464

Bill: Getting into Usenet from the boat can be done with a portable satellite telephone terminal. That's expensive. Also, the portable terminal
may not be equipped to track as the boat rolls. I remember a Prodigy classroom thing from last year where some fellows were sailing from San Francisco to Boston around Cape Horn and stayed in touch on a daily basis. I believe, though that they received faxes, and sent replies via radio for forwarding into the Prodigy system. With the quality of ship-to-shore HF, you don't want to try using it for data. Even the ham AMTOR system isn't particularly efficient on HF at 300 baud and slower. It would take you awhile to read your usenet news. HF ship-to-shore might be useful for E-mail. See if someone else can provide better input about this.

The weather seems to be cooperating.
The high altitude balloon launch for Saturday, Nov 12 from Central Kansas
looks like it will happen.
I will be running the HF net from the launch site on 7.155 mhz.
WB0DRL will chase the balloon (it is his balloon) in a light airplane.The
scheduled launch time is 9AM CST, 1500Z
GPS packet data will come from the balloon on 144.340
See you on 7.155

1870. Meaning of NASA Keplerian Elements

Newsgroup: rec.radio.amateur.space
Date: 1994-11-12 01:09:23 UTC
From: lsn92@ecs.soton.ac.uk
Message-ID: <26087.9411120059@life.ecs.soton.ac.uk>
Source record: 26472

Hi there,

I am a beginner in satellites.

I seek further information and comments about the NASA compatible
Keplerian Element Set, otherwise known as the two-line Keps. By this I
mean the Keps set compatible with the Keps set ftp'able from NASA at
spacelink.msfc.nasa.gov:/Instructional.Materials/Satellite.Tracking.

Are there text books/published articles cover all the Keps described in
the NASA Keps Set? (Please see example. Do anyone know G.L.Carman's
email address (signature in the example) ?)

What are n.mi. (in terms of kilometers), apsidal rotaion, nodal
regression, nodal period, epoch rev.?

Are there any resources about this subject on the Internet?

Thank you.

Yours,
Liang S. Ng

1872. Re: Where to find Julian Date Table on Internet

Newsgroup: rec.radio.amateur.space
Date: 1994-11-12 04:47:10 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.784615630@BIX.com>
Source record: 26473

It's reasonably simple to calculate Julian dates using an algorithm
that was printed in Computer Language magazine, December 1990. I
don't still have the original article handy, but I did rewrite the
code as a C shell script for my Hamilton C shell under NT or OS/2.
(Sorry, this will NOT work under the Berkely C shell on UNIX.)
Hopefully, the code will be clear enough that you can transcribe
it easily enough into C or Fortran or whatever's your favorite.
Anything you don't understand, just ask.

Here goes:

```
# Calculate the Julian day number for the specified date.
# Based on algorithms published in Computer Language magazine,
# December, 1990. Used with permission.

proc julian(month, day, year)
# The Julian day number is the number of days between noon GMT
# Jan 1, 4713 BC and that date. (Years B.C. are negative.)
local a, b, year_corr, Month, i
set Month = January February March April May June ^
July August September October November December
if (year == '') then
local dt
set dt = `dt`
@ year = $dt:3
if (day == '') then
@ day = month == '' ? $dt:2 : month
@ month = $dt:1
end
end
if (month !~ '[0-9]*') then
@ month = "$lower(month)*"
for i = 0 to 11 do
if (lower(Month[i]) =~ month) break
end
@ month = i + 1
end
if (month < 1 || month > 12 || year < -4713 || year > 2900) then
echo -2 julian: Invalid Date
return -1
end
# Correct for negative year.
if (year < 0) then
@ year++
@ year_corr = 1
```

```
@ b = 1
else
@ year_corr = b = 0
end
if (month <= 2) then
@ year--
@ month += 12
end
# Cope with the Gregorian calendar reform
if (year * 10000 + month * 100 + day > 15821015) then
@ a = year//100
@ b = 2 - a + a//4
end
@ a = floor(365.25 * year - year_corr) + ^
floor(30.6001 * (month + 1)) + day + 1720994 + b
# 4713 BC was not a leap year.
if (a < 59) @ a++
return a
end
```

What are you wanting to receive ?

Most TVRO receivers with L band input can be converted by changin the LNB to a Ku-band LNB. There are Dual band Polorotors that allow C & Ku band operation on the same dish.

To obtain any of these services, just send a message to the address

listserv@amsat.org

For the moment, the maintenance of the AMSAT.ORG mailing lists and
remailing aliases is done manually. Later, this service will
probably be automated and you will have to follow a strict message
format. For now, you may send requests in free format. They will
usually be processed within a few days. In general, you will not
receive an explicit reply to your request. Be sure you specify:

1. Which mailing list(s) you want to receive

2. Your callsign, if any

3. The Internet address to be used, if different from the
one in your From: header.

Hello Folks.

I am looking towards the design of an experimental amateur space probe, such as was proposed to fly alongside Amsat Phase 3-D, and need some help finding modelling software. Earth orbit stuff and planetary orbit stuff is almost ten-a-penny compared with probe path design! *Any* help would be much appreciated!

Mike.

Are you sure about this? I don't think the surface of the moon is
a reasonable radio reflector (otherwise we wouldn't have bothered to
put mirror cells on the moons surface to measure it's distance
accurately) and the signal would have had to pass through the
various atmospheric boundaries twice. Considering the (poor)
quality of signal that can be received by NASA from the shuttle, in
near orbit after a single passage through the atmosphere I would be
surprised if a voice signal could be succesfully bounced off the
moon.

>amateur radio astronomer's reach?
>
When I was at University of Sheffield, England, circa 10 years
ago,we had a meteor radar that could track the ionisation trail
through the atmosphere, and was considered state of the art. What
you are suggesting is much more difficult, not from a computing
viewpoint (a basic PC could eat the problem) but from the signal
strength.

You are talking about sending a signal right out of the atmosphere
(several magnitudes harder than the meteor radar), bouncing it off
an asteroid (several magnitudes less radio reflective than a meteor
trail, and at least an order of magnitude further away) and
receiving a signal back through the atmosphere. You would also
have to do this for long enough to establish a trajectory against
a very noisy background.

I think your chances are slim to non-existent, but please prove me
wrong!

Peter Gore

Hello!

I'm looking for additional informations about ZSSRD 2 aka WSTRN.
It is a relaystation for communication with Mir. The position is 16 Deg.
West.

I wonder, what's the :

- Catalog number (NORAD/NASA)
- Intl. designation
- Launch date
- Launch vehicle
- Launch site
- Mass at launch

There are two transponders between 10.832 GHz and 11.5 GHz.
Somebody told me, that there are sporadic broadcasts from Mir.
Can these broadcasts be received with an ordinary TV-Sat-Equipment?
In Germany?

Has a release more current than 7.0 been made for JVFAX? Version 7.0 has
a few bugs in transmitting SSTV. On some images the program locks up
transmitting a grey-scale. On other images it rotates the left hand
with the right hand portion of the image.

I heard a rumor the bugs were fixed a new release made, but have not been
able to confirm the new release or even find it.

Does anyone have any other information? Inquiring minds want to know. :-)

SUNSAT micro-satellite launch on stream for 1996.

Stellenbosch University's SUNSAT micro-satellite is proceeding full steam for launch in January 1996 on a US Air-Force McDonnell Douglass (MDA) Delta 2 mission from Vandenberg Air-Force base in California.

Following a favourable programme review at Goddard Space Flight Centre in September, NASA and South Africa's Foundation for Research Development are setting up an inter-government Memorandum Of Understanding (MOU). NASA will arrange launch of SUNSAT in exchange for orbit data from a precision

NASA-supplied satellite navigation receiver in SUNSAT. The data will be used by NASA for gravity field research.

Successful technical meetings with SUNSAT engineers last week at Vandenberg Air-Force Base, and at McDonnell Douglass in California approved SUNSAT's ground operations plan and launcher interfaces, and enabled launch vehicle modifications to begin.

Stellenbosch is ready to start modal survey tests on SUNSAT's structure im mid November as required by NASA, but must still find sponsors for the solar panels and extendable boom (R400 000 total). These two USA items were originally planned to be sourced from the USA.

SUNSAT, is a small (50kg), cost effective imaging satellite that provides the core student activity in the Electronic Systems Laboratory in the Electrical Engineering Department at Stellenbosch University. Denel's termination of its satellite programme, an activity unrelated to SUNSAT, leaves the university laboratory as South Africa's only centre of expertise and development in this field. The laboratory regularly attracts foreign visitors, is starting to export technology, and led to a first Conference on Small Satellites in October, which attracted papers from four overseas countries.

SUNSAT is a low earth orbit satellite to provide high resolution images for environmental purposes, store and forward data communications, and is also part of a programme to interest school children in technology.

SUNSAT has been developed by 23 graduate engineering students at Stellenbosch and UCT since 1992, together with academic and technical personnel. Ninety percent of its computer, communications, and imaging technology is directly applicable in terrestrial systems, hence its support from industry in furthering engineering research and education.

Prof. G.W. Milne
SUNSAT Project Leader.

Hi Roger, The up-link frequency for Mir is 145.55 Mhz

As far as power requirements, I would suggest that you have a good look at your station. One watt with a good antenna can make it, but yes but, you'll have to have good timing and pray that no-one else is trying to uplink at the same time. I am not saying that you have to run a 150 watts either. I would suggest that you play around with maybe 25 watts or so and a small beam antenna.

Mir uplink 145.55 downlink 145.55

Just to solve one point of contention regarding this thread...

Yes, some hams have been bouncing signals off of the moon for years.
We call it, appropriately enough, "moonbounce."
I wouldn't exactly call the antennas that are used for this "modest,"
however, in contrast to those used by NASA,etc., they could be considered
modest.

Yes, stations like KB2AH and OE9XXI can talk to each other on 1296
MHz. KB2AH has a homebrew 34 ft. dish and runs something like 500 watts.
OE9XXI runs about 1 kW to a 9 meter dish. I know that Tom's dish
barely fits in his residential yard.

1898. Summary of Nov. 12th balloon flight

Newsgroup: rec.radio.amateur.space
Date: 1994-11-15 14:59:27 UTC
From: djs19@ksu.ksu.edu
Message-ID: <3aaicf$t5a@matt.ksu.ksu.edu>
Source record: 26501

November 14.1994

Summary of November 12 balloon flight.

The SSOK (Sky Science Over Kansas) group launched and recovered its 9th payload.

Wind at the launch site played a major role in moving the release time up to 1336 UTC instead of 1500 UTC. Surface winds ranged from 10 to 15 knots with gusts to 20 knots. A large cotton sheet was draped over the balloon to carry it out of the inflation building and into an open area. This sheet was held by 6 people and it kept the balloon from being controlled by the wind. Once at the launch area a string lanyard was attached and the sheet removed, the balloon was allowed to ascend under lanyard control until high enough for the "runner" to get the payload underneath to release.

Ascent rate averaged between 800 to 900 feet per minute and a maximum altitude of 111,523 feet was reached. Recovery was 109 miles from the launch point which was near Topeka, Ks. This flight is the second in a row that the landing has been observed by a member of the recovery team. The aircraft that was using the low power beacon on 147.31 mhz for direction finding nearly intercepted the descending payload and parachute at 2500 feet. The aircraft circled the payload until touchdown and waited for the recovery team which was minutes behind.

Had the gps side of the payload failed the low power beacon would be the only way to locate it, and by powering it off of separate batteries it can last up to 10+ days.

More flights are planned for the future and should be just as interesting and fun as all the previous ones. Total participation was around 20+ for launch and recovery plus many more that listened in and gave reports. THANKS..

1899. DO-17 (DOVE decoding)

I'm looking for a P.C. program to decode the Dove telemetry. My daughter is doing a science project on satellites and this seems like the perfect addition to her study, ie. the tracking and decoding of satellite telemetry.

Anyone know of an "ftp" site where I can get a decoding program (with instructions)?

Please E-mail direct to: sem2r@galen.med.virginia.edu

Thanks!! STACEY / WB4QKT

1902. Antennas for Pacsat dwnlink.

Newsgroup: rec.radio.amateur.space
Date: 1994-11-16 01:37:40 UTC
From: wk@muscle.frc.maf.govt.nz
Message-ID: <WK.94Nov16143740@muscle.frc.maf.govt.nz>
Source record: 26500

I am trying to get a mode jd microsat station up and running, playing around with a TAPR PSK kit, homebrew UHF-> 10 m converter, IC725, TNC2 etc.

Also, I am trying different antennas for the downlink. So far I have built and tried a Lindenblad and a GP. Not getting terribly good signals, I recently built an MRF66 masthead preamp which made a big difference.

Anyway, on most passes I can get a solid lock if signals are over S3, and I start copying frames when signals get up to S4-S5. With signals below S5, the modem is locked on, and 3 segments of the level bar graph light up, indicating a noisy signal. As soon as signals get up to S5, only one or two segments light up brightly, and I can copy the frames. The threshold point seems to be fairly sharp.

Nevertheless, with the small omni directional antennas I still get lots of fade outs and violent QSB. The GP produces usable signals only on few passes, when the sat passes to the west of me, and low above the horizon. Presumably, the polarisation and takeoff happen to match my GP and signals are remarkably stable for minutes on end. Most of the time however, I don't copy any frames at all.

The PSK mode seems to work well, but still it appears to want a fair amount of signal and good S/N, certainly a fair bit more than HF AMTOR.

As I am still in the process of improving the downlink performance, I was wondering if I need to go to directional, tracking antennas to solve the marginal copy. Do people here use omni antennas and get reliable results, or should I be able to get the present setup to work?

My next step is to change the GP for the Lindenblad again (this time with the preamp), trading off early copy for better signals during the middle of the pass.

Any hints regarding downlink antennas appreciated, will summarise if enough interest.

Cheers, Wilbert.

I put the following summary together from some resources I found plus some explanations for Gil Carman (WA5NOM). I originally put it together to give out to people on the Shuttle Elements Mailing List since this is a Frequently Asked Question from new list subscribers. Hope this answers some of your questions. This does not specifically refer to the NASA two line element sets but many of the fields are the same.
--GaryM

----------<cut here>----------<cut here>----------<cut here>----------

The Keplerian Elements Sets are orbital tracking data is intended to be used in by a satellite tracking programs. They use the data to compute where the satellite should be at any particular moment in time based on it's previous location and known velocity. The data comes in various formats, one is called NASA Two Line Elements (TLE) and another format is the AMSAT format show below. There are other formats and other coordinate systems used.

Here is a sample of AMSAT format elements with a short explanation on each data item.

Satellite: STS-65
Catalog number: 23173
Epoch time: 94201.28966185 (20 JUL 94 06:57:06.78 UTC)
Element set: GSFC-042a
Inclination: 28.4662 deg
RA of node: 281.0136 deg Space Shuttle Flight STS-65
Eccentricity: 0.0003249 Keplerian Elements
Arg of perigee: 78.0464 deg
Mean anomaly: 282.0512 deg
Mean motion: 15.91226612 rev/day Semi-major Axis: 6676.9815 Km
Decay rate: 5.4802E-04 rev/day*2 Apogee Alt: 300.76 Km
Epoch rev: 186 Perigee Alt: 296.42 Km

Satellite - This is the common usage name of the spacecraft.

Catalog number (object number) - This is the chronological reference number assigned by USSPACECOMM (formerly NORAD) to each new spacecraft when it is established in orbit. A particular spacecraft may be referred to either by its name or catalog number.

Epoch time - This parameter is the Julian date to which the other parameters are referred. The Julian date consists of the last two digits of the year (94), a 3 digit day of the year (July 20 is the 201st day of 1994), and the fraction of the day (Noon is .5000). Universal time (UTC) is used.

Element set - This parameter is the set sequence number as issued by NASA and this number is modulo 999 (range 1-999).

Inclination - This parameter is the orbit inclination in degrees. This is the angle between the orbital plane and the equatorial plane of the Earth.

Right ascension of ascending node - This parameter is the angle in degrees to the point where the ascending orbit crosses the equater (where the spacecraft is moving from south of the equator to north of the equator) at the epoch time specified in the set. It's measured relative to the inertial X axis (first point of Aires), like star coordinates.

Eccentricity - This parameter is the orbit eccentricity. A value of 0.0 would be a perfectly circular orbit.

Argument of perigee - This parameter is in degrees for the epoch time specified in the set. It is the angle measured in the orbit plane in the direction of motion, from the ascending node to the point of perigee.

Mean anomaly - The angle (also measured in the orbit plane in the direction of motion) from perigee to the satellite. Finding the actual position of the satellite involves solving Kepler's equation to convert mean anomaly to eccentric anomaly and true anomaly, but we won't go into that here.

Mean motion - This parameter is in orbit revolutions per day.

Decay rate - This parameter is one half of the first time derivative of mean motion (Ndot/2). They did that for convenience, since that's how that term appears in the series expansion for propagating the mean anomaly. (The next term to the right of Ndot/2 in the NASA 2-line elements is the second time derivative of mean motion, divided by 6 (Nddot/6). Normally this term is zero if the mean motion is reasonably linear; however, non zero values will start showing up for very low altitude satellites with decay rates that are increasing with time.)

Epoch revolution - This parameter is the orbit number count at the epoch time specified in the set.

: Yes, some hams have been bouncing signals off of the moon for years.
: We call it, appropriately enough, "moonbounce."
: I wouldn't exactly call the antennas that are used for this "modest,"
: however, in contrast to those used by NASA,etc., they could be considered
: modest.

And few of them 'talk', either. The only really useful mode is CW (Morse
code) due to the extreme path loss and the various fading modes between
here and there (and back!). A slow CW signal is only ~100Hz wide, where
a SSB phone transmission is ~2.7kHz wide. Usual ERP levels are well over
1kW, too. Not exactly cordless phone power levels, I'd say... :-)

> tracking program like Quiktrak, InstantTrack or PCTrack (all DOS), for
> os LINUX ?
> Many thanks for your answer.
> regards
> Hendrik Jassies.

Bob Kupiec was kind enough to provide an FTP site from which SatTrack V2.0
can be obtained. Do the following:

ftp ftp.jvnc.net (128.121.50.2)
login anonymous
binary (this line is important!)
cd /pub/priv/kupiec/sattrack
get sattrack.V2.0.tar.Z

Place this file into your Unix home directory, uncompress it, and then type
'tar xvpf sattrack.V2.0.tar'. This will unbundle the distribution file
and will create all necessary sub-directories. Then look into the documentation
file 'sattrack.doc' in SatTrack/doc for instructions how to compile sattrack
(and some other auxiliary programs). It should compile perfectly on at least
Sun-3's (SunOS 4.0.3), SPARCstation IPCs (SunOS 4.1.1) and i386 laptops
running Linux. Make sure the compiler and linker flags in the Makefile
are configured properly!

Future releases are expected to feature the SDP4 model for satellites with a
period of more than 225 minutes and X Window graphics with a color world map
tracking chart (V3.0).

Version 2.2 is an improved version of V2.0 and will be ready for release
very soon. Stay tuned ...

Please let me know how the installation went and if you encountered any
problems, bugs or imperfections.

First of all - this is an amateur radio group - rec.amateur.radio.space. This is not alt.sci.skeptic or alt.bozo.weekly-world-news

>The Mars Observer was a NASA probe to Mars that FAILED less than a week in
>Mars orbit

Actually it failed a couple of days before entering orbit around Mars due to a faulty design in its propulsion system. The details are publicly available and can be verified by examining the backup spacecraft still on the ground.

> after transmitinting the SPHINX images from the MARS surface
>(available at CYBERDEN in Forbidden Subjects - Dir).

Sorry - the only image which the Mars Observer Camera (MOC) transmitted back was a long distance shot showing half of the planet from a fairly far distance, not much better than what can be done from Earth. Any other images which you've seen have come from supermarket tabloids and their sources.

> Just a few years
>earlier te Russians sent a probe to Mars and it also "disabled" - these >probes are known to last decades in space on atomic batteries... What >Gives???

Well you're wrong on three points. Most planetary orbiters (not probes) do *NOT* last decades. For a planetary mission the typical duration is about two to three years plus travel time to the planet. And almost all of them use solar cells. The only inner solar system scientific spacecraft to use atomic batteries were the Apollo ASLEP packages and Viking landers.

What are your sources for your aleged information? Do you have anybody as a reference which has ever been published by the American Geophysical Society, American Astronomical Society, National Academy of the Sciences, or any other recognized scientific organization. (And the Federation of American Scientists does *NOT* count - they're almost as bad as the supermarket tabloids!)

For the record - my sources are the principal investigator for the Mars Observer Camera, the project manager, project scientist, and the head of the board which investigated the Mars Observer failure. In my experience they are not lying to me, and have adequately explained the reason for Mars Observer's demise. Hogland and the like have not done so.

not on the mission which just finished (STS-66). While Ellen Ochoa has a valid amateur radio license the decision was made not to manifest SAREX on that flight for various reasons.

The next SAREX mission will be STS-67, currently scheduled for late February 1995. It will include several hams on the crew, most notably Dr. Ron Parise WA4SIR.

I'm working on a SAREX FAQ document and plan to post it by early January so it will be distributed well before the mission.

1916. sat03nov.zip - Fast Satellite Tracker by DL3HRT & DL3HZM

Newsgroup: rec.radio.amateur.space
Date: 1994-11-18 00:58:02 UTC
From: hansky@Igel.Physik.TH-Zwickau.DE
Message-ID: <9411180058.kp5334@SimTel.Coast.NET>
Source record: 26312
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.space

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/hamradio/
sat03nov.zip Fast Satellite Tracker by DL3HRT & DL3HZM

This program allows to track up to 700 satellites. The tracking is done
eigther in real-time or in the delta-t mode. 16 satellites are presented
simultaneously in the real time table.

Features:
* up to 700 different satellites
* using AMSAT and NASA format
* optional calculation of AOS (Appearance Of Satellite) and maximum
elevation
* optional acustic signal triggered by AOS/LOS
* prediction protocol to textfile
* prediction also for two sites
* select the second observer from up to 2000 locations
* locator-coordinate-distance computation
* worldmap with spotlight
* azimuth-/elevation graphic with optional presentation of horizon
* information system for particular satellites
* bi-lingual (English and German)
* all data files are text-type files
* selecticve update of element sets when using NASA format
* display of the sun terminator

Minimum configuration:
* PC-AT 286 and above
* abt. 200kByte disc capacity
* abt. 400kByte free memory when using graphics
* EGA/VGA-graphic

Optional:
* Arithmeticprocessor
* Mouse

sat03nov.zip has replaced sat04aug.zip.

Hi, I am not sure of the info you need? A good place that you can try is the Marshall Space Flight Centre BBS in the USA (205) 895-0028 running 9600 baud. Sorry, don't know if they have email availible.

They do have info on just about all satellites in orbit as well as future projects. Good Luck with your quest.

Frequencies would not help. The HST communicates with the TDRS satellites, not directly to the ground. The TDRS sats use a very narrow beam, high bandwidth/data rate and are almost cetainly encrypted.

Mike.

1920. STS-64 QSL Address?

Hi Ron,

I envy you.

I called TAPR earlier this week and was told that the next batch won't be
available until March and they will accept an order until January.

I ordered it sight unseen, and asked for the brouchures to be sent
after I made the order :-).

Could you tell me what the development tools (assemble, compiler, etc)
are like? (I presume the DSP code is in RAM and I don't have to burn a new
set of ROM each time?) And will I be able to get hold of the tools
before the next batch of kits ship?

Also, could you tell me if the DSP-93 can be run standalone (from a ROM)
without using a PC, once the code is developed?

My objective is the best HF modem one can build for RTTY :-). I used
to do DSP even before the days it was called DSP (certainly before Parks
published his Remez-exchange program) and it would be fun to play with
that stuff again. Have been into graphics algorithms lately.

All SAREX QSL requests are handled by ARRL now. I believe you send to the
standard address and note that you are QSL/SWL'ing STS-64.

Date: 1994-11-20 01:41:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <50.365.2922@freddy.supernet.ab.ca>
Source record: 26330

Hi Erik,
AO-27 is only active on the weekend and only if the control
station turns it on! (They are very forgetful)
AO-27 operating notes; uplink 145.850 Mhz (low power only
please)
; downlink 436.800 Mhz (when the bird
first comes into view, the downlink frequency will be upto 10kcs higher
so check you frqeuency. This is very important on low orbit birds were
the dopler shift is large
; the satellite will only work if it is in
sunlight (solar power) and if on high power will have about 1 watt
output from the transponder. Low power about 1/2 watt.

Other notes: this bird is only on over Europe and North America or so
I'm told.

Good Luck and maybe you'll catch one of us VE's over the pole.

Miles and daughter,

Great thought! I have not heard of a Macintosh version but that means little. An MS-DOS decoder is available via FTP from:

pilot.njin.net
/pub/SpaceNews/software
duvdec10.zip

FTP the index (00_index) for the list of much more of interest.

All of the above is available to us through the efforts of
John Magliancane, KD2BD, of Brookdale Community College in New Jersey.

That is correct. The first batch is set to be shipped RSN

There is an assembler, programming interfaces, documentation and lots of
sample code. Contact TAPR about early release.

> Also, could you tell me if the DSP-93 can be run standalone (from a ROM)
> without using a PC, once the code is developed?

There are changes in process to allow code to be added to the ROM. Right
now it is RAM bnased.

What's the S meter read with no satellite signal? Sounds like your receiving setup has a high noise floor. A signal 12 db (two S units on a calibrated S meter) above the noise should be solid copy. Seems like that's what you're getting now, but that your noise floor is about S3. You might want to do some system noise figure and sensitivity measurements to find out where that excess 18 db of noise is originating. I'd suspect the downconverter. Are you using a proper post-mixer termination? How free of phase noise is the LO? Etc.

>As I am still in the process of improving the downlink performance, I
>was wondering if I need to go to directional, tracking antennas to

Omni antennas can work. Your system noise figure may not be optimized yet.

>My next step is to change the GP for the Lindenblad again (this time
>with the preamp), trading off early copy for better signals during the
>middle of the pass.

A well constructed Lindenblad will solve most of your fading problems since it offers circular polarization. Of course that's assuming it's built correctly. My first one was a disaster.

>Any hints regarding downlink antennas appreciated, will summarise if
>enough interest.

Tracked CP beams are best, no doubt about it, but the GP vertical
and the Lindenblad should both work better than you are reporting.
What filter width are you using in your receiver? A good 500 Hz
filter will boost the SNR quite a bit.

The signals go through the TDRS satellite relay system. They're at
microwave, broadband digital, and multiplexed with all the other
signals TDRS handles. There's not much chance an amateur can intercept
and decode them without fairly sophisticated equipment.

>"Pushing" against the galaxies preventing them from unwinding.

Yes, there are stars between galaxies, not many, but some (It's assumed
they are runaways from a galaxy since the intergalactic medium is assumed
to be thin enough to prevent star formation there). There is no sharply
defined galactic edge in the sense of a line beyond which we can say,
galaxy this side, inter-galactic space this side. The drop in number of
stars on the Rim is more gradual than that, but still sharp enough that
seen from the vantage of another galaxy, galaxies have definite form.

The Dark Matter hypothesis is still just a hypothesis, and it doesn't
work the way Tom suggests in any event. Dark Matter is not just ordinary
matter in too small a concentration to gather under gavitational influence
and light off nuclear fires to become stars. Dark Matter is posited to
be some, as yet unknown, form of matter that has practically no interaction
with other more mundane matter, but that does have mass. This Dark Matter
has to be uniformly distributed *inside* a galaxy in order to explain
the rigid disc-like motion of galaxy rotation. It's not something pushing
in from the outside. "Where's the missing mass?" is the pressing question
in cosmology and subnuclear physics. There have been many proposed answers,
ranging from quantum black holes to a neutrino "gas". But no one knows
for sure what Dark Matter, if it exists, is. It may turn out that there
is no Dark Matter, and that the answer lies in another direction entirely.

On yesterday's This Week In Amateur Radio program, N9LTD, who does the Easy Sat's segment was talking about receiving the weather satellites. I have been interested in doing this, and have an Icom R-7000 receiver that I have used to listen to them with.

I have not wanted to spend the money for the demodulator card for my PC. On yesterday's program, N9LTD mentioned receiving the satellites and putting the audio into a sound blaster card. He mentioned that there was a shareware program that would convert the sound file to an image.

This sounds great to me. Does anyone know what the name of the shareware file is, and where I can get it?

You'll find the Mac version at

ftp.demon.co.uk /pub/ham/mac

It's called EZ Dove.sit. If you're interested there are a lot of other
amateur radio programmes in there including several Sat Tracking.

Regards,

Sean.

> How free of phase noise is the LO? Etc.

The noise floor lies at S0 and AO16 becomes readable at S3-S4 which is 18-24 dB over the noise. The down converter response is not entirely flat, as the sat band is 3 MHz wide, but I have staggered the two coupled tanks at the output of the converter to give me a similar noise floor from 27 MHz (=435 MHz) to 30 MHz (=438 MHz).

The converter uses a crystal controlled LO, not a PLL, and the phase noise should not be too bad. The crystal train design is from a German book called UHF Unterlage. The mixer is an SBL-1, both RF and LO ports are padded (2dB on the RF port, 3dB on the LO plus an additional 6 dB pad to get the LO level down to 7dBm).

The IF port uses a PI network to achieve a 50 ohm load at all frequencies present (ARRL handbook 1990 page 12-25 fig 34), followed by a dual gate FET with double tuned circuits in the output.

The IC725 receiver has a built in preamp, which I normally use as it gives a slight improvement in copy, and it brings the S meter to life.

As I mentioned before, I use an MRF966 mast mounted preamp (ARRL handbook) under the GP, then 15 m of RG58 which probably eats up most of the claimed 20 dB of preamp gain. The signal is beefed up in the shack by a 2 stage amplifier (2 x BFY96) with adjustable gain, then into the RF port of the SBL-1 via the 2 dB pad.

I have attempted to use cookbook receipe designs for the converter as I have no test and measurement gear for UHF other than a dummy load and a RF sniffer for amplitude measurements. Anyway, it is not unrealistic to have a problem in the downconverter, and I am going to borrow a commercial UHF rig with a 2SK97 front end and try that in place of the converter business...

> Omni antennas can work. Your system noise figure may not be optimized
> yet.

That is good to know, I don't have space for a steerable array.
The other thing could be the TAPR modem. I have gone through the
TAPR alignment procedure (which is excellent) with a scope, function
generator and a counter, and it all went according to the docs. The
modem copies itself in loopback mode OK, but there could be a slight
problem with the Costas loop resulting in degraded sensitivity, but I
am hesitant to touch it :-) The PLL locks on at S2, but I don't get
copy until the sigals get over S4, which is quite strong (18-24 dB
over the noise floor).

> A well constructed Lindenblad will solve most of your fading problems
> since it offers circular polarization. Of course that's assuming it's
> built correctly. My first one was a disaster.

Well I can report back on the Lindenblad: I tried it on a dozen passes
and it suffered just as badly from QSB as the GP. In fact, the
Lindenblad did not seem to give me the nice strong signals that I get
from the GP during low elevation passes and during overhead passes it
seemed to be just as bad as the GP with long fade-outs. I have gone
back to the GP and flagged away the overhead part of the pass, which
is only 20 percent of the time anyway.

Listened to AO16 today which passed at a max elevation of 40 degrees,
and got 10 minutes worth of pretty good signals using the GP. Yes the
Lindenblad is a constructional nightmare and when it is finished, it
looks like a bizarre wind mill, guaranteed to attract comments from
the neighbours :-)

> Tracked CP beams are best, no doubt about it, but the GP vertical
> and the Lindenblad should both work better than you are reporting.
> What filter width are you using in your receiver? A good 500 Hz
> filter will boost the SNR quite a bit.

I tried using my 250 Hz (-6dB) CW filter but the 1600 Hz carrier would
not fit through it. The IC725 has a regular CW mode, which I reckon
uses the LSB filter setup, as sensitivity and selectivity are
specified the same for both CW and SSB. It might be worth getting a
500 Hz CW filter but you would have to tune for a 1000 Hz carrier and
re-align the TAPR modem to work with that... I take it you have tried
receiving 1200 bps PSK through a 500 Hz passband?

Anyway, may next job is to try with the borrowed UHF rig to see if the
down converter is the problem...will keep you posted.

From: jsi@vipunen.hut.fi
Message-ID: <3apdra$b83@nntp.hut.fi>
Source record: 26342

Leonid meteor shower peaked on last friday, Nov 18 at 07 UT. According to OH5IY's recordings at 87 MHz the peak was slightly better than the Perseids' peak this year ! The Leonids are showing increased activity much earlier than expected ! Visual observations as well as meteor scatter experiences by a number of amateurs confirm the increased activity.

The Leonids have a 33 year period and they have been expected to peak for storm-level activity in 1998 or 1999. The previous peak in 1966 yielded about 60 000 meteors per hour, for 40 minutes ! Well, sure looks promising for 1998 or 1999 !

For those interested in hot data, Leonid 1994 data file for OH5IY's MSSOFT (v4.2f) is available at ftp.funet.fi:/pub/ham/vhf-work/msdata94.zip

: I called TAPR earlier this week and was told that the next batch won't be
: available until March and they will accept an order until January.

Yep - them are the breaks....but glad you made the order. We have 60 or
so of the 150 slots filled for the March production. Taking order until
Jan 1st or so.

The big problem here is that it only makes sense for us (TAPR) to do
kits of this cost in larger runs....the hassel of getting parts in small
qtys for a continuous run and or putting all our cash assets in a kit
production so that we can't continue to work on other things just isn't
possible with the cost of the units.

: I ordered it sight unseen, and asked for the brouchures to be sent
: *after* I made the order :-).

Great! I think you will like it.
The enclosure came out looking really nice!

: Could you tell me what the development tools (assemble, compiler, etc)
: are like? (I presume the DSP code is in RAM and I don't have to burn a new
: set of ROM each time?) And will I be able to get hold of the tools
: before the next batch of kits ship?

: Also, could you tell me if the DSP-93 can be run standalone (from a ROM)
: without using a PC, once the code is developed?

Yes to all.

The newest MONITOR code has the ability to load programs stored in EPROM
for operations. The main reason here is for automated users.

TASM 3.0 is what we are using. A Table driven system. Although Ron and
Bill Beech have commented off and on on doing something for the DSP-93.

You can load obj files into the unit by three methods, at the DOS
prompt, using a Windows development system, or the Mac development
system. The win and mac system support a spec analyze, scope and
probably more instruments as they are developed.

They surprised me at the AMSAT meeting with the working scope program in the windows program -- always like little surprises like that :-)

: My objective is the best HF modem one can build for RTTY :-). I used
: to do DSP even before the days it was called DSP (certainly before Parks
: published his Remez-exchange program) and it would be fun to play with
: that stuff again. Have been into graphics algorithms lately.

This sounds like you need to be in on the TAPR HF SIG. They are working on improving HF digital communications. Send a message to listserv@tapr.org and in the message body say 'get tapr taprinfo.txt'

This file will tell you all about the SIGs and how to join and get more information.

They are spending a lot of time right now on simulators.

Sorry about the big gaps in production runs, but hopefully with all the interest in the unit and the great software development happening before and I figure after the first production, it should be a matter of time before folks want to OEM the design and produce it commerically.

Cheers - greg

P.S. For those waiting - if you don't make the March Production, the next one will probably be August/Sept 1995.

: 73, Rick, WB7UGZ

Yes, the program is called sbdsp. It works quite well. A bit trick to work out the numbers initially, but not bad.
However It samples at 9600hz and for a 8 minute pass you get a 4.6MB file. Then you run this through sbdsp and get another 4.6Mb file. This second file is raw data and must be loaded into something like imdisp or the image machine or winlab. I recommend winlab it's quicker than the image machine and Imdisp is harder to drive.

You should note that the fm bandwidth of the wefax signal is around 38kHz and that your whites will be very badly crushed, but well worth having a go. If you need any further help the mail me.

From: rr03@nyssa.swt.edu
Message-ID: <3aqq3h$rp@central.server.swt.edu>
Source record: 26347

I had the pleasure of watching MIR course across the morning sky today. I also listened to it on a scanner. Rather often, a short burst of packet noise broke through the static. There were at least 10 of these bursts over a 2 or 3 minute period. Each burst lasted a second or less. Not having any sort of a packet translator, I'm curious as to what was being broadcast from MIR. Can anyone help?

I've been hearing these packet bursts on most passes that I've been able to monitor over the past two weeks. It appears that ever since the last crew of three, including the ESA astronaut, returned to earth around November 4, MIR has been making packet noises.

Ok, your design sounds good, and if you really do have 24 db over the noise (most S Meters lie) the modem should be working like gangbusters. I'm not the best one to be telling you how to optimize system noise figure, Zack Lau is much better qualified, but I'll give you a simple test to try. See if your noise floor drops slightly when you replace the antenna with a dummy load. At 2 meters, a good system should be slightly quieter than atmospheric noise. If so, you'd be wasting your time trying to get it better.

>The IC725 receiver has a built in preamp, which I normally use as it
>gives a slight improvement in copy, and it brings the S meter to life.
>
>As I mentioned before, I use an MRF966 mast mounted preamp (ARRL

>of the claimed 20 dB of preamp gain. The signal is beefed up in the
>shack by a 2 stage amplifier (2 x BFY96) with adjustable gain, then into
>the RF port of the SBL-1 via the 2 dB pad.

Yucko! :-) Still if it passes the above test, it's good enough. I'd try to use better cable and lose the 2xBFY96's. They're mostly acting to degrade the noise figure in the current setup. You need enough gain at the mast top to overcome the cable loss and the mixer loss. The latter should be around 6 db for your setup, and you're probably losing in excess of 8 db in the RG-58. You don't want excess gain before the filter, that can lead to IMD problems.

>I have attempted to use cookbook receipe designs for the converter as
>I have no test and measurement gear for UHF other than a dummy load

>unrealistic to have a problem in the downconverter, and I am going to
>borrow a commercial UHF rig with a 2SK97 front end and try that in
>place of the converter business...

A pulsed noise source, circuit in the Handbook, is the tool you need
to tweak system noise figure. Remember tweak for best noise figure,
not best gain. They are often rather radically different. Input tuning
is the critical parameter for preamps.

>> Omni antennas can work. Your system noise figure may not be optimized
>> yet.
>
>That is good to know, I don't have space for a steerable array.

>copy until the sigals get over S4, which is quite strong (18-24 dB
>over the noise floor).

Ah, well, the problem could be here, or in the radio. If you're getting
a signal from the radio with phase distortion, that could explain the
problem, or, as you suggest, you may have a modem problem. If you can
borrow the scope again, look at the received eye pattern. Look for
tilt on the rails, or distortion of the eye at bit center. Both are
indications of phase distortion. Also watch the clock jitter, if it's
high but the eye looks clean, it may indicate a PLL problem.

>> A well constructed Lindenblad will solve most of your fading problems

>back to the GP and flagged away the overhead part of the pass, which
>is only 20 percent of the time anyway.

Uh, oh, sounds like my first attempt. Double check the phasing harness,
you've got one turned anti-phase, that's why you're getting all the
nulls on the Lindenblad.

>Listened to AO16 today which passed at a max elevation of 40 degrees,
>and got 10 minutes worth of pretty good signals using the GP. Yes the
>Lindenblad is a constructional nightmare and when it is finished, it
>looks like a bizarre wind mill, guaranteed to attract comments from

>the neighbours :-)

Yep, it's ugly all right. Say, if you can tape record the satellite pass, it'll give you a signal source for tweaking the modem.

>> Tracked CP beams are best, no doubt about it, but the GP vertical
>> and the Lindenblad should both work better than you are reporting.

>500 Hz CW filter but you would have to tune for a 1000 Hz carrier and
>re-align the TAPR modem to work with that... I take it you have tried
>receiving 1200 bps PSK through a 500 Hz passband?

Um, no. That gem of wisdom applies to the 400 bps telemetry beacons. The math says you need a bandwidth of 1.9 kHz for 1200 baud PSK (to the first nulls), but the math is a little conservative. Sorry to have led you astray with that comment, you'll need to use the SSB filter, and try to center the signal in it's passband. If you don't have IF shift, and I don't think the 725 does, you may need to retune the modem anyway to center the signal somewhere around 1250-1300 Hz to avoid asymmetrically chopping the signal. Look at the eye first, that will tell you. If you see compression at top or bottom, you're not centered well enough in the filter.

>Anyway, may next job is to try with the borrowed UHF rig to see if the
>down converter is the problem...will keep you posted.

Ok, but I'm beginning to suspect that isn't your problem.

>"shuttle atlantis" (or whichever) "this is my callsign"? I want to make
>sure I do it properly.

For Mir, I usually call them in a normal fashion (to some extent) I've seen Musa Manarov, and Sergei Krikalov, use a slightly different approach. Both work, but the Russians get a slightly better response most of the time!

For Mir, I have been using the callsign known, or thought, to be current, say, R0MIR this is N5JXS, OVER. Use good practice, fairly short calls, and if you try to use phonetics, use the international (ICAO) phonetics, rather than something that sounds "catchy". Those guys are not always real good linguists, and in a lot of cases, their English skills are limited to the aviation world, where ICAO phonetics are standard. If you speak Russian, even a little, that can improve your opprotunities...

For SAREX, I'd STRONGLY recommend giving your callsign only once per transmission, in ICAO phonetics. A number of the astronauts have been heard to say that they will only answer ICAO phonetics if things are busy. That's what THEY are used to, also. Also, if they are busy working a large group, don't make lengthy calls, or use the vehicle name, or any of the "tricks" we seem to have picked up working DX pile-ups. Part of their training is working HF pile-ups, and they get some ideas pretty quickly of what they do NOT like in operating habits... being the subject of a pileup, they can choose who they'll talk to, and do so!

> I have an HT and I understand they can work but I may need higher
>power and a better antenna to increase my chances. I know the uplink is
>145.550, I suppose I need to switch to the downlink after I make my call
>to hear their responce. What is the downlink frequency? Any help on
>getting me started on these contacts would be appreciated. My license
>should be here in about 5 weeks so I've got some time to learn what I need
>to know. Thanks!

Mir is on simplex, on 145.55o MHz. If you happen to hear them somewhere else, they have a sked and are really doing something. Period. Similar tale for

SAREX. We do not have the scheduled school contacts on published frequencies. But, it's not too difficult to find someone if you know when they're gonna be talking, and have a scanner. If SAREX is heard, and is NOT on 145.55, they are busy, and not likely to want to talk to someone they weren't expecting!

The SAREX downlink for general QSOs is 145.55 MHz. The crew listen on any one of 5 uplinks: 144.91, 144.93, 144.95 (which is conveniently the standard offset of 600 khz), 144.97, or 144.99. It's suggested in training that, if they're on one uplink and things get too busy, just change, and DO NOT ANNOUNCE they're changing to another uplink. You'll still hear 'em on 145.55, just another group got a chance to talk, those on then newly selected uplink.

We did have one mission (STS-50) where, due to some problems, the crew elected to do ALL SAREX operations on one frequency pair: 145.55 down, 144.95 up. That was schools, general QSOs, everything. The crew (KB5SIW and KB5SIX) asked for consideration, and received it, whenever they had a scheduled contact. I'd hope it'd continue to happen.

If you've other questions, drop me a note.

>73, Rick, WB7UGZ

Rick,

Sorry, I should have given the file names on the program. Try these
files:

SBDSP.ZIP (37k) The original Soundblaster APT converter program for DOS.
Takes .VOC files produced by SoundBlaster (or
compatables) and converts them to a format that can
be read by _some_ viewers.

SBPW31.ZIP (59k) Windows version of above.

WLAB.ZIP (856k) Elaborate picture editing program that _should_ be able
to view the output file from SBDSP.ZIP.

DSPSHELL.ZIP (42k) Also converts SoundBlaster .VOC output to an image file.

WXMAN20.ZIP (264k) Hold your SoundBlaster microphone up to the speaker of
your HF rig and copy WEFAX pictures off the air.

I wish I could tell you that I've tested all the programs above and that
they work as advertised, but I haven't. Soon, I hope. Meanwhile, if you
want to try them, they're on the Clear Skies BBS in Madison, Wisconsin,
at (608) 249-7130 (14.4k). I hope to be trying them in the near future
and I'll let you know what I discover.

Dave, N9LTD
Please send any email to djmullen@facstaff.wisc.edu

Packet is method used to send information over radio waves using a radio, computer,keyboard and Terminal Node Controler or TNC. The way Mir is most often used is sort of a message BBS. They will upload messages for their friends to download later from anywhere on the globe. Another common mode is to use Mir as a repeater. People can then use VHF to transmit over a thousand miles typing messages into the computer. Mir will also send out an ID message if all is quiet.
If your curious, just stop by a Ham radio shop and ask to see an operating packet setup. The Ham Radio Outlet near me has one setup. I must admit packet is sort of a world different than what I had expected.

I've used WXMAN20 and it works well, however the signal I used w waass
a U.S.C.G. HF retransmission not directly from the satellitte. I
think you might have a problem with the direct reception because of
the circular polarization and the bandwith of your receiver. But
give it a shot...Its an inexpensive way to get APT.

Does anyone know of a modification for the Bearcat 560 that would give it the proper i.f. from 35 to 50kHz for receiving APT signals? Secondly, does anyone have any experience with the hamtronics or vanguard receivers? I am trying to setup a sat. reception system for my elem. science classes despite budget restraints and other teachers who think I'm nuts. Any help is most welcome.

Hi,

Can someone tell me how to go about getting a QSL
from the MIR? I managed to work itbut lost it while sending
a message because it went out of range. Does this qualify me
for a QSL? Who should I send anything to? Any information
would be appreciated. Thanks.

Hello Rick,

There is indeed documentation for OrbiTrack however you can only
get it by registering your copy, it is Shareware after all, well
worth the money IMHO.

As to another satellite programme for the Mac SE you might find
MacSat more to your liking. It's really a stripped down version
of OrbiTrack but might suit your needs better on the 9" B&W
screen. I'll try and upload it tonight so it should be available
within the next 48 hours or so.

If you need anymore info please let me know.

I have a Vanguard Wepix-2000 receiver that seems to function. However, it
had at least three cold solder joints in it that prevented the recovered
audio from coming out the connector on the back. You could hear it fine from
the internal speaker. Doesn't look like they do good (or any) QA before
shipping.

Source record: 26363

Wel, it looks like I have it sorted out. Following Garys comments regarding noise performance and gain distribution in my 70 cm -> 28 MHz down converter, I made a few changes:

The converter has been moved to the laundry, now only 10 m away from the GP. The 20 odd metres of RG58 now carries the 28 MHz IF to the shack, instead of 437 MHz. Also, I got my hands on some expensive looking 50 ohm coax (RG213 size, but double screened, core and braids silver coated, don't ask me what it is...) to connect the masthead preamp to the converter.

I dug out my old noise source and re-aligned the MRF966 masthead preamp with the GP connected, and the noise source coupled into the GP via a rubber duckie. Optimised for noise this time, not gain.

Anyway, to make a long story short, I logged a 58 deg. elevated pass of WO18 at S9 and copied endless streams of telemetry for up to 12 minutes. I can hit AO16 and LO19 whenever they are higher than 20 deg. With the converter out of the shack I have also eliminated a few birdies coming from the PC.

The two stage front and amplifier is still needed at the SBL-1 RF port. I had a discussion with Wayne ZL2BKC, a long time UHF/SHF nut, who reckons the masthead amp should be set up for a gain to make up xmission line losses to the converter plus 9dB SBL-1 conversion loss (includes 2 dB for the RF port pad) plus another 10 dB to lift the signal well clear off the SBL-1 noise floor. So, ignoring xmission line losses, a total front end gain of at least 19 dB is needed. The MRF966 is good for 20, so I guess that explains the need for the extra front end amp to compensate for xmission line and connector losses.

Having seen the light, I am now planning to combine MRF966 with the converter and put the whole lot up under the GP, running 28 MHz straight to the shack. Doing this, I shouldn't have to use that dodgy additional amp at the front end anymore, which should benefit the dynamic range.

Indeed the GP is able to comfortably pull in the signals of all but the highly elevated passes. Obviously I need a dipole or a quad loop for those steep passes. Am toying with the idea of putting a loop around the GP, a quarter wave above the radials which would be nice and compact, and maybe turn the GP into a 5/8th to increase low angle gain.

The uplink needs some work too... surprisingly the pacsats can hear my 5 watts FM PSK into a half wave vertical, parked in the corner of the

lounge. They must have pretty good receivers in them. Thanks are due
to KE4ZV and others for the useful, constructive comments.

Yup and you can also ftp keps from Nasa Spacelink. Ftp to:

spacelink.msfc.nasa.gov /pub/Instructional Materials/Software/Tracking Elements/

The latest file was posted today. The file contains 2 line keps for a LOT of sats including Mir, HST, TDRS, etc. They work great with STSorbit plus. They are very accurate as well.

1969. NASA Media Workshop

Newsgroup: rec.radio.amateur.space
Date: 1994-11-25 14:49:18 UTC
From: afn05824@freenet3.freenet.ufl.edu
Message-ID: <3b4the$l5d@freenet3.freenet.ufl.edu>
Source record: 26373

NOTE TO EDITORS: N94-82

JSC HOSTS MEDIA WORKSHOP FOR JOINT SHUTTLE/MIR MISSIONS

Astronauts, flight controllers and program managers will describe NASA's upcoming cooperative missions with Russia during a media workshop to be held at the Johnson Space Center (JSC) Dec. 14-16.

The three-day media workshop is designed to provide reporters with background information that will prepare them for the first joint missions between the U.S. and Russia and will focus specifically on the next flight, STS-63.

In February 1995, the crew of STS-63 will perform a rendezvous with and fly-around of the Russian Space Station Mir. STS-63 will set the stage for a flight in late May, when the Space Shuttle Atlantis will dock with the Mir for the first time. That mission, designated STS-71, will be the first of seven docking flights currently scheduled over the next three years.

"We are entering a new age in the space community," said Tommy Holloway, Phase One program manager and one of the workshop briefers. "In the past, our human space flight programs have generally been focused on one program and its supporting organizations. But now we are bringing together the space programs of two nations to accomplish an integrated mission that will strengthen both."

The first day of the workshop is designed to provide reporters with the framework for the cooperative missions. Briefings on joint flight control, orbital mechanics and the Mir station are among those scheduled. In the afternoon, tours of the new Consolidated Control Center and simulations of the Mir fly-around will be available.

-more-
-2-

The workshop's second day is devoted to the traditional pre-flight briefings for STS-63. The lead flight director, payload managers and crew members will discuss the mission's activities, goals and objectives.

The third day offers a look ahead to STS-71 and into the next century when multi-national cooperation in space will be

the backbone of the International Space Station.

The event will close with a presentation by NASA public affairs officials regarding coverage and media support for the joint missions. Briefers will discuss what provisions are being made for the media in the U.S. and Russia, and will explain what kind of television support will be available.

The tentative agenda for the workshop follows (All times are EST):

Wednesday, Dec. 14, 1994
9-10 a.m. -- Phase One Overview
10-11 a.m. -- Joint Flight Control and Training Overview
11-11:45 a.m. -- Orbiter Docking Equipment
11:45 a.m. - 1 p.m. -- Mir Familiarization
1-1:30 p.m. -- Orbital Mechanics and Rendezvous Basics

Afternoon -- Tours and Hands-On Activities*
Consolidated Control Center Tour
Proximity Operations Simulation

Thursday, Dec.15, 1994
9 - 10:30 a.m. -- STS-63 Mission Overview
10:30 - 11:30 a.m. -- Spacehab-3
11:30 - 12 noon -- Spartan-204
12 noon - 12:30 p.m. -- Secondary Payloads
2 - 4 p.m. -- STS-63 Crew News Conference
4 - 6 p.m. -- STS-63 Crew Round Robin Interviews*

Friday, Dec. 16, 1994
9 - 10 a.m. -- Early Look at STS-71
10 - 11 a.m. -- Looking Toward Space Station
11 - 1 p.m. -- How to Cover the Missions

All briefings (except those activities with *) will be carried live on NASA Television with two-way audio question-and-answer capability from other NASA Centers.

-more-
-3-

Reporters planning on attending the workshop at JSC should contact Kari Fluegel at (713) 483-5111 to ensure that adequate materials are available. Those wishing to participate in the round-robin interviews with the STS-63 crew members should contact Kyle Herring at (713) 483-5111 by Dec. 9.

NASA Television is available from GTE Spacenet 2, Transponder 5, Channel 9 at 69 degrees West Longitude. The transponder frequency is 3880 MHz and the audio subcarrier is

6.8 MHz. The polarization is horizontal.

-end-

NASA press releases and other information are available automatically by sending an Internet electronic mail message to domo@hq.nasa.gov. In the body of the message (not the subject line) users should type the words "subscribe press-release" (no quotes). The system will reply with a confirmation via E-mail of each subscription. A second automatic message will include additional information on the service. Questions should be directed to (202) 358-4043.

KRAFT TO HEAD INDEPENDENT SHUTTLE WORKFORCE REVIEW

Dr. Christopher C. Kraft, former Director of the Johnson Space Center, will form and lead an external independent team to review data from the Space Shuttle Functional Workforce Review and make recommendations to Administrator Daniel S. Goldin for implementation, Goldin announced today.

The Space Shuttle Functional Workforce Review was initiated in September 1994 to evaluate the resources and the requirements being expended on human space flight -- with program safety the first priority.

Kraft's team, which will be formed by the first week in December, is charged with evaluating the current process and procedures for conducting Space Shuttle operations at the Johnson, Kennedy, Marshall and Stennis Space Centers and related contractor activities with the intent of recommending a new and more optimum operating structure. Kraft's team also will provide recommendations on a plan to transition to any new organizational structure. Initial efforts will focus on Kennedy Space Center operations. As part of his charter, Kraft will review the management and contractual relationships for the operation of the Space Shuttle program.

Kraft's team will review related Space Station activities, as required, to ensure the necessary Space Shuttle Program support of the International Space Station.

The effort will be supported as required by NASA and reviews with the various NASA Centers and involved contractors will be an integral part of the effort. It is expected that Kraft's team will complete their work and make recommendations by March 15, 1995.

- end -

I'm a high school physics teacher looking for challenging projects for my brightest students. I would like to use a macintosh computer as a digital signal processer to convert and display NOAA APT satellite weather images. It seems that it should be possible to use the mac's A to D capability to digitize the amplitude modulated 2400 Hz carrier and then write an application to act as a scan converter to convert the digitized sound file to a PICT or some other kind of graphic format. I would guess that timing to get the right scan pattern would be the tricky part.

If anyone out there knows of such a program I'd be interested before we reinvent the wheel! --

Thanks,

Haven't seen the 560 but have done it to the Bearcat 145 and 175. Generally, all you have to do is locate the 2nd if filter (ceramic, possibly #SFR455D), small orange rect. shape; replace it with .01mfd capacitor. You will more than likely need a schematic to determine this.

--See also article "73 Amateur Radio Today" magazine, 3/91, page 12.

--Hamtronics have a good reputation, will ending paying slightly more over a modified scanner though, depending on the model.

Software Systems Consulting used to sell modified Bearcat 145s for around $150.

"Voyage Through The Solar System" is a new CD-ROM featuring full motion video and images from NASA and the Jet Propulsion Laboratory in an easy to use program interface.

The package has received great reviews and operates on DOS windows and Mac. USA today describes the images of Jupiter as "impressive". Slide shows, dozens of videos all with imformative narration and wonderful music on each body in our solar system.

BULL! I have 2 cards from MIR to prove it. The route is:

RV3DR - Sergej Samburov-Space QSL Manager
Chief of Cosmonaut Amateur Radio
Department NPO Energia
PO 141070, Box 73
Kaliningrad-10 city,
Moscow Area,
RUSSIA

as actually printed on the card, see... (holding card up to screen)

By the way, the QSL's were for getting a BUSY signal from
the packet station, and they indicate 2-way QSO.

73 - AL

Hi all,

I'm N9LTD and I do the EZSAT Report on This Week in Amateur Radio
every other week. I've gotten quite a bit of interest in weather
sat decoding since last week's show and several people have requested
software to decode WX Sats and WEFAX using their Sound Blaster sound
cards.
I've got the software on my BBS in Madison, Wisconsin at
(608) 249-6359, but that's inconvenient for people in other countries.
Does anybody know of a good FTP site I could upload these files to?

Thanks,
Dave, N9LTD

1985. A Challenge to Each of You

Newsgroup: rec.radio.amateur.space

I have read some of the postings of this newsgroup for some period of time and I am impressed with the level of expertise shown in receiving sat signals and decoding into "fax photos," from weather satellites.

However, I have a challenge for you to try.... At ftp.digital.com /pub/net/infosys/Netscape there is a new piece of web software called Netscape that will show you how to build your own Web server. For those of you who have all of the sophisticated equipment that we can 1) not afford, 2) not understand, you might want to put your realtime receptions on the web so we can all see them... and, better still would be to use the Netscape facilities for resolution enhancement, if we want a more detailed view.

Hope you are up to it.

1986. SGP4/SDP4 C Library

Newsgroup: rec.radio.amateur.space
Date: 1994-11-27 17:37:15 UTC

Message-ID: <26373.9411271726@life.ecs.soton.ac.uk>
Source record: 26389

Hi there,

I am looking for SGP4/SDP4 Model of orbit determination implemented in C programming language. Look angles and range are required as output with the Two-line-elements set as initial input.

I understand that Pascal and Fortran implementation can be obtained from archive.afit.af.mil. I don't suppose the C implementation has been completed?

Otherwise, has anyone tried interfacing the Pascal SGP4 library (SGP4-PL2) with a C program? Any particular glitches to watch out?

Thank you.

Yours,
Liang S. Ng
Southampton Univ.

: I've used WXMAN20 and it works well, however the signal I used w waass
: a U.S.C.G. HF retransmission not directly from the satellitte. I
: think you might have a problem with the direct reception because of
: the circular polarization and the bandwith of your receiver. But
: give it a shot...Its an inexpensive way to get APT.

: Regards,
: Rolf Mathison
: rolf_mathison@HPATC1.desk.hp.com

Plus, APT from the orbiters is an FM signal with an AM subcarrier, which needs to be demodulated to extract the imagery. The software for the Sound-blaster can accomplish this.--Optimum bandwidth for APT is 40-50khz, narrower bandwidths will give up some of the available grey-scale.

Having an antenna that uses right-handed circular polarization will greatly improve the signal; omni-directional antennas do a decent job.

Haven't seen a release of the preliminary Keps as yet, launch has been postponed to Dec. 6.--More than like NOAA-14 will probably be assigned 137.620, since NOAA-11 recently bit the dust.

1994. Does black PVC pipe have an effect ?

Newsgroup: rec.radio.amateur.space
Date: 1994-11-27 19:10:44 UTC
From: gkennedy@helix.net
Message-ID: <n9CskClgnEIP055yn@helix.net>
Source record: 26396

Good Morning/Afternoon/Evening/Whatever !!!

I have recently built a quadrifilar helix antenna for my APT work (137 MHz), but I am noticing some strange nulls in the pattern.

I am using *BLACK* PVC pipe as the main structure for this antenna, and metallic parts, other than the elements.

My question is this: I have heard rumors that the pigment in the pipe is mostly Carbon Black, and that this may affect the efficiency of the antenna, as the pigment will cause the pipe to act as an element. WHITE PVC doesn't have this problem.

Is this true ? I've never heard any discussions about this before, nor have I seen any references to this in any antenna books I have seen over the years.

Also, does anyone know what effect painting the elements has ? I have to do something to protect them from the monsoons we have here in Vancouver, and I want to make the antenna as inconspicuous as possible (I painted the elements black......).

Thanks in advance for your input !!

oak.oakland.edu is the obvious choice. They originate SimTel, the
sysadmin is a ham, etc.

Has anyone used the new windows software from amsat? I believe it is
called
kimsat and provides the software to work all the packet satellites.

Hello Rick,

There is indeed documentation for OrbiTrack however you can only
get it by registering your copy, it is Shareware after all, well
worth the money IMHO.

As to another satellite programme for the Mac SE you might find
MacSat more to your liking. It's really a stripped down version
of OrbiTrack but might suit your needs better on the 9" B&W
screen. I'll try and upload it tonight so it should be available
within the next 48 hours or so.

If you need anymore info please let me know.

FTP site details,

ftp.demon.co.uk /pub/ham/mac

Rick,
I sent in my shareware fee at least a year ago and NEVER got any
docs.
The check was cancelled though. I'd like to know what happened to
further development on what I think is still the best mac-based tracking
program out there.

My 2 cents worth

the
> contact!!!

BULL! I have 2 cards from MIR to prove it. The route is:

RV3DR - Sergej Samburov-Space QSL Manager
Chief of Cosmonaut Amateur Radio
Department NPO Energia
PO 141070, Box 73
Kaliningrad-10 city,
Moscow Area,
RUSSIA

as actually printed on the card, see... (holding card up to screen)

By the way, the QSL's were for getting a BUSY signal from
the packet station, and they indicate 2-way QSO.

73 - AL

Hi,

Can someone tell me how to go about getting a QSL
from the MIR? I managed to work itbut lost it while sending
a message because it went out of range. Does this qualify me
for a QSL? Who should I send anything to? Any information
would be appreciated. Thanks.

Subject: solar system CD-ROM

"Voyage Through The Solar System" is a new CD-ROM featuring full motion
video and images from NASA and the Jet Propulsion Laboratory in an easy
to
use program interface.

The package has received great reviews and operates on DOS windows and
Mac. USA today describes the images of Jupiter as "impressive". Slide
shows, dozens of videos all with imformative narration and wonderful
music
on each body in our solar system.

Source record: 26399

Concerning black PVC:
I'm very sorry to be the bringer of bad news,
but black PVC does indeed mess with RF.
Our LOWFER group learned of this while attempting
to use colored PVC for antenna coils.
White PVC worked very well.
Unfortunately, black paints will also upset your
system, since they also contain carbon black and
other RF-hot compounds.

I'm working on a FAQ for SAREX and it should be ready to be released in late January 1995, well before the next SAREX mission, STS-67 (currently scheduled for February 1995).

> I need to know who to
>contact for a pre-arranged QSO during a Sarex Mission in June of 1995.

Pre-arranged QSOs can only be set up for educational groups for educational purposes, and the proposals have to be sent in as early as possible to the ARRL educational department. And you're assuming that there's going to be a SAREX mission during your event - not a good assumption to make, even if one happens to happen around then.

Almost. It is called Wisp, and it works with most of the packet satellites.
There are some birds that do not use the standard format, but Procomm works
with these just fine.

You can FTP wisp (and a few other things) from ftp.teleport.com in
/pub/users/n7ryw

This had me wondering about something - The standard NBFM filters are too narrow to do a good job, but i have a RS2006, which can also do wideband FM. How does that filter work for the satellites in question. I've listened to them go over in WBFM mode and I hear a good signal - but then what I hear might not be what a demodulator needs.

Also, How complicated is the following AM demodulator to build up? Schematics available on an ftp site? (although from reading this, looks like I can plug the 2006 right into the SoundBlaster and off we go. Right?)

Kevin

Source record: 26407

```
Observed 50.61 deg NLat, 7.55 deg ELon; NOV 27, 1994

Following the satellite-name you read the approx.
hour (local=sun-time) and motion-direction of the
pass (N=northbound, S=southbound).
This time +/-1.5h is valid for the next 10+ days
to expect the satellite to be visible in range of
northern-hemisphere-stations, add 11h and switch
S<->N for another pass to observe.

NOAA-9 09:S APT 137.62 MHz On
NOAA-10 16:N APT 137.50 MHz On
NOAA-11 16:N APT 137.62 MHz AVHRR dead
NOAA-12 09:S APT 137.50 MHz On
Meteor 2-21 12:S APT 137.85 MHz On
Meteor 3-5 20:N APT 137.85 MHz OFF
OKEAN 1-7 11:N APT 137.40 MHz OFF

APT of OKEAN 1-7 was off during all available
passes. NOAA-11 transmits signal but imaging
is dead. Meteor 3-5 drifted into morning darkness
and is off now. Meteor 2-21 is active, signal is
weak. No other APT-signal 137.00-137.99 MHz
between 0700-1900 UT.
9 days until launch of NOAA-J December 06.

>Kevin

Kevin,
A local ham, KA9WBX, uses a Radio Shack Pro - something scanner set to wide band FM mode and gets great APT pictures. However, he's feeding it with his oscar beams. The main problem with the wide band FM mode is that it's TOO wide band and your signal to noise ratio suffers. The extra gain from the beam makes up for the extra bandwidth. Don't know how it would do with an omnidirectional antenna.

The Sound Blaster is being used essentially as an analog to digital converter and the amplitude of the 2400 Hz tone is determined by actually measuring it.

The converter in the "Weather Satellite Handbook" uses an op-amp to rectify the 2400 Hz tone, then it runs that signal into an 8 bit analog to digital converter and your computer eventually ends up measuring its amplitude too.

>I've tried to use WISP but I was not able to insert the satellite element.

Insert? To get the elements into the program, choose "Database" from the main GSC menu, and then "Update Satellite Database". You can then get the elements in from an Amsat or 2-Line type file. Make sure there is no extra text in a 2-line file, or it won't get read right.

Then, you need to select "Setup" and then "Satellite Setup" and enter all of the information for a satellite in the boxes. There is quite a bit of information needed here, and be sure to get it all in or it won't work.

>I'm not a registred user, so I've pressed the button "I wont a trial",but
>following the setup instruction gived in GETSTART.TXT I haven't had any
>satelllite in the database.
>Is the unregistred capability limitated to a quick look to the graphic
>interface of the program or some error was made by me?

It is fully functional in every way. Above all, make sure that the element file you are using does not have any "junk" text. Most do when they are sent. Also be sure to go through all of the setup menus and enter all of the information requested.

Have fun!

I've tried to use WISP but I was not able to insert the satellite element.
I'm not a registred user, so I've pressed the button "I wont a trial", but
following the setup instruction gived in GETSTART.TXT I haven't had any
satelllite in the database.
Is the unregistred capability limitated to a quick look to the graphic interface
of the program or some error was made by me?
Thank's in advance

I used WISP for about a month before I registered it. As far as I can tell the unregistered program is fully functional. The only effects of being unregistered are the annoying "register me" window that you described and the fact that the unregistered copy places a code (letter W?) in the keywords field of any message that you upload to a satellite.

Aside from some minor bugs, WISP is a *wonderful* program. It makes working the microsats a very straightforward task. It is *well* worth the $40 registration fee.

Hmm, well I have oscar beams too, so that should work. But beyond that, I
imagine you might be able to post process the audio some to improve the
signal to noise ratio. But the soundblaster probably already does that
for you.

Thanks for the info, Dave.

Sigh....looks like I have to go shopping....I don't think the local
store has white PVC.....anyway, the existing pipe should be easy to
replace.....

I just don't like the thought that the antenna will now be less
conspicuous....right now you can almost stare right at it and not know
it's there <grin> !!!

Pick up a copy of Electronics Now dated August 1994. You will find plans
on building a turnstile dipole for satellite wefax reception. I have received
satellite weather fax on my Kenwood R-2000 with the VHF option. It works fine for this.

The exact freqs are:

NOAA-9 137.62 MHZ
NOAA-10 137.5 MHZ
NOAA-11 137.62 MHZ
NOAA-12 137.5 MHZ

By the way, WeatherMan version 3.0 is on the way soon. It has automatic
phasing and a tuner built in. For more information please contact
the author of WeatherMan Paul Hitchcock at "paulhtc@netcom.com".

Hi,

Not much luck though. I don't think there is a completed C library for SGP4/SDP4 at the moment, although Dr. Telso who wrote the Fortran and Pascal library mentioned there was such a plan.

So the next best thing is to call the Pascal function from a C program.

There is a glitch (in Pascal to C interfacing) which I just found, and it is quite a big one actually:

Turbo Pascal does not generate Object codes which you can link with a C program!

So the next best thing to do is to the compile Pascal SGP4/SDP4 library into binaries (.EXE or .COM) and put the SGP4/SDP4 binaries resident in memory. Create some interrupt hooks to the resident SGP4/SDP4 functions which can be called from another (C or others) program.

This is just what I plan to do with it.

Hope this helps. Any other suggestions?

Yours,
Liang S. Ng
Southampton University

2012. WISP Problem

Newsgroup: rec.radio.amateur.space
Date: 1994-11-30 19:37:38 UTC
From: Robert D Houghton <rhought@cello.gina.calstate.edu>
Message-ID: <3bika2$48s@cello.gina.calstate.edu>
Source record: 26173

Starting yesterday, I began having a strange problem with the satellite scheduler feature of WISP. The scheduler is listing predictions with the date set to 1-1-70. At first, the "correct passes were displayed along with these incorrect ones. Today (November 30) only the passes dated 1-1-70 are displayed. This effectly blocks WISP from running the MSPE module to begin a satellite pass. The problem is date related: If I set the system clock back a few days, everything works ok. Is this a bug in WISP or am I overlooking something?

Here is the info on the software I'm running:

WISP registered running under windows 3.1 / PC dos 5.0

GSC 0.84d
View-Dir 0.75a
MSPE 0.98g
UpdKeps 0.70
MsgMaker 1.13
ProcMail 0.94
MsgView 0.98A

If anyone has any suggestions or knows of a fix, I'd appreciate your help.

2018. 144 Mhz EME - Minimal Station Requirements

Newsgroup: rec.radio.amateur.space
Date: 1994-12-01 07:04:00 UTC
From: tim.marek@megasystem.com
Message-ID: <215.608.1443@megasystem.com>
Source record: 26171

I've seen some message here that leave me thinking some folks are confused about the mechanics involved in EME (Earth Moon Earth) communications. First of all practically ALL EME communications are done using CW. Signals are SO weak their barely above the noise floor. Of course the superstations like W5UN and K5GW can be copied with a single yagi at Moonrise but one interested in consistant results on 144 Mhz should aim for the following station...
4 Yagis at least 3.2 Wavelengths long in phase on a "H" frame of some sort (Usually 13 FT. square) that can elevate as well as rotate so it can track the Moon as it traversesthe sky.
A .5 DB or less noise figure Preamp with 20+ DB gain.
700 or more watts output from a High Power PA.
A good reciever coupled into some audio filtering.
A station with these parameters will be 3 DB above the noise at Perigee barring atmospheric/Lunar conditions.
My station is all homebrew including the Rotor and Thrust Bearing plates, Antennas, H frame, and elevation drive. Its up 23 ft so when elevated it clears the roof yet allows one on the roof to perform periodic maintaince without to much trouble. This is all for 2 Meters mind you... On 432 Mhz it a bit differant... With the smaller wavelength Dish antennas start to become reasonable in size and are gaining in popularity. Regardless how you get on the Moon, It's never a sure thing even for the big boys. I guess thats why I enjoy it so much... You never know what to expect next. I hope this has given some of you something to ponder. For a real good history or "Weak Signal" VHF work including EME I highly suggest picking up from ARRL a copy of "Beyond Line of Sight" by Emil Pocock - W3EP. It's a wealth of info I wish existed when I got started chasing grids back in 91' 73s es DX from DM09ep de NC7K...sk

Get the newer versions of the files! Chris identified this problem and has
fixed it in the latest GSC. There were some changes a few versions back that
require all the new files, so replace ALL old files at one time.
They are at:

ftp.teleport.com/pub/users/n7ryw

If you have WWW, use it instead at:

http:/www.teleport.com/~n7ryw/asatpage.html

The WWW has the version numbers listed, so you can compare and get the files
you need.

Good Luck!

If you are getting a sharing error, you need to be using SHARE.EXE to enable
file sharing, or Wisp won't work properly (or at all). See the help file for
some settings for Share.

>Tim.Marek@Megasystem.Com

Tim has quite a station, particularly being all home brew. The thought
of building, buying or whatever a similar station is what stopped me
from doing EME for many years. I just don't have the resources to do that.
Tim can hear his own echoes. That makes him a big gun in my books.

I started last year with 2 long yagis mouted vertically on a horizontal
cross boom, with a TV style rotator motor turned sideways (it only had
to last one weekend, it did) as the elevator motor. I used a bought
ARR preamp and a 400W brick. It was all bought.
I worked W5UN and heard 5 others. It was really
the biggest blast I'd had in 30yrs of ham radio. It was enough encouragement
to do it bigger this year. If I hadn't been able to do it in a small way
last year, with the promise of being able to work something like VE3ONT,
I wouldn't have done it at all, and I would have missed out and I
still would not be doing it this year.

This year I built some yagis for 432 and worked NC1I (the biggest
station on 432) - again one contact for a years work, and that took an
hour of NC1I's time (thanks Frank).

You don't have to climb all hills at once like the pioneers of
EME did. A little bit at a time is also OK. It took me 20 yrs of thinking of
it in Tim's terms before I could do it this way.

Hi,

I am looking for any amateur satellites/OSCAR with FM/AFSK/FSK downlinks and their frequencies.

I have only back issues of AMSAT UK Oscar news until February 1992. And with that I managed to find the frequecies of DO-17, UO-14, UO-22 and KO-23. I am interested if KO-25 has also FM downlink and what its frequecy is. I am also interested in any other OSCAR with FM downlinks.

I would like to resubscribe to AMSAT-UK Oscar News now. But retrieving the back issues could be a problem. Do you have any suggestions?

My main concern is the downlink frequencies of satellites with FM downlinks. Could any one suggest a good source of reference?

Thank you very much.

Yours,
L S Ng
Southampton

As far I know this is accurate.

POSAT(POSAT1) 145.975 FM 435.2777 FM 9600 Baud FSK

---

1) Frequencies shown are without Doppler compensation. For typical digital satellite pass the original signal will be about 8 kHz higher than what is shown.

2) WO-18 Webersat transmits experimental and image data and can be captured in KISS mode via PB or TLMDC.

3) Except for FO-20 the digital sats use a program suite containing PB/PG/PFHADD/PHS or WISP. The broadcast callsign (in PB.CFG) is the satellite's callsign with an SSID of -11. The connected mode callsign (in PG.CFG) is the satellite's callsign with an SSID of -12.

4) When in mode JD, FO-20 can be worked with any packet program. Connect to 8J1JBS. FO-20 currently alternates between modes JA and JD on a weekly basis. Check ANS bulletins for schedule.

5) AO-10 is no longer controllable but the transponder works when the satellite is in sunlight.

6) For AO-10 and AO-13, transmit LSB, receive USB. As transmitted frequency is increased the received frequency will decrease, (inverting transponder).

7) AO-21 currently operates on a 10 minute schedule with FM repeater, WEFAX image transmission, and 1200 baud AFSK telemetry in each cycle.

Reasonably accurate but AO-21 is dead so nothing will be heard there. FO-20 sends digital a lot of the time the rest of time is on sideband.

2029. HRPT Data for Georgia Coast?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-02 17:12:24 UTC
From: Ken Terry <ken_terry@macmail.eng.gulfaero.com>
Message-ID: <3bnkhoINNI7j@gulfaero.com>
Source record: 26181

I have a small AVHRR system, and my apartment does not allow me
enough room to catch all of the Georgia coast from a polar orbitors pass.
I have software to work the raw HRPT data, and I am looking for a
internet connection to near real time HRPT data for Georgia. I have
found a station that does this for Hawaii, and some tiles for the West
Coast.
Has anyone located an internet connection for near real time HRPT
data that covers Georgia? In advance, thank you very much!

Ken

2030. Alinco ALD-24T Mods?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-03 02:53:41 UTC
From: crowner@magnus.acs.ohio-state.edu
Message-ID: <crowner.27.2EDFDDB4@magnus.acs.ohio-state.edu>
Source record: 26183

I just picked up a used Alinco ADT-24T. This is a fairly old radio (several years anyway, I haven't tried to look it up) but it seems like a nice one.

Does anyone have modifications for it for things like 430-440 MHz coverage or wiring in a 9600 baud modem? I'm contacting Alinco for the tech manual, but that takes a few weeks, and previous experieces are hard to beat anyway.

Thanks.

>
>The international designation is Cosmos 2054.
>
>Does anybody have more informations or even experiences with this bird?

Here are the two lines for the bird you are looking at

COSMOS 2054
1 20391U 89101A 94335.07419160 -.00000127 00000-0 00000-0 0 943
2 20391 2.7237 67.0694 0001843 116.1226 257.0895 1.00267121 18347

The NASA BBS from which these came is also reachable via Internet, if you do not want to pay for the phone call, but would rather have your company or university shout the bill.

The site is "oig1.gsfc.nasa.gov" and is a TELNET site. Login as "oig" with the password of "goddard1" and take it from there. You can then FTP files back to your machine once you are logged into oig1

```

Notes:

. % : transmitter outage during the whole hour or a part of it. Low counts indicate that no other interference, which could be confused with meteors, is picked up.
Few transmitters are broadcasting between 2h-4h local time (Sat-Sun 3h-5h local time) or sometimes longer. (When winter hour is in use: local time = UT + 1h).

. & : manually eliminated for direct reception.

. * very strong Leonid activity on the morning of November 18.
The Leonid radiant rises at 22h30m, and sets at 14h UT. Best forward scatter conditions for this setup around 7h - 8h UT.

Maurice De Meyere / Chris Steyaert

Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: narrow band FM, detected signal level >-122dBm.
Antenna: 2 element Yagi with 4dBd gain to SW.
Antenna Azimuth: 45 o
Computer: T-1000SE
Data sampling system: threshold crossing detection is fed in binary form (1 bit) from the receiver, to the computer.
Computer logs total hourly elapsed reflection time, number of threshold crossings for the hour, the longest time the signal was continuously above detection level for the hour.

Data stored in the Compact MS-Soft format. Software for viewing available from FTP.FUNET.FI pub/ham/vhf-work/mssoft42.zip

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

2039. KO-23,KO-25 down?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-04 19:46:24 UTC
From: n7ryw@teleport.com
Message-ID: <n7ryw.60.0013C691@teleport.com>
Source record: 26194

I have not been able to get any data down from KO-25 or KO-23 for the last couple of days. I have checked in on AO-16, and all works good. I have also used Terminal to see if there is any data at all from these sats, but nothing monitored. Has there been another failure? Has anyone else noticed this?
Bill, n7ryw@teleport.com

Yes, it's true, as verified by responses to the previous posting as well as other sources, both Kitsats are DOA (Dead On the Air). They are transmitting dataless carriers, so it may appear that there is something wrong with your equipment. This time, it's the birds gone phlooey again.

Curious that they did it at the same time.

>What radio frequency would you have used to listen to the
>Space Shuttle STS-64 mission?

Well, you'd have to go out about ten times the diameter of the solar
system to be able to catch up with the STS-64 mission because it landed a
couple of months ago ...

In any case, the SAREX (Shuttle Amateur Radio EXperiment), transmits on
145.55 Mhz. (FM) when it's in use. Different uplink frequencies are used
for different purposes and regions.

The next SAREX mission will be STS-67 in February 1995, with Ron Parise
WA4SIR and several other ham and non-ham astronauts.

From: caver@acca.nmsu.edu
Message-ID: <3c0oul$o8h@dns1.NMSU.Edu>
Source record: 26202

I'm sure most of you are aware of the Pentium chip floating point division bug (or 'flaw' as Intel prefers to phrase it). If you don't know about the bug, go read comp.sys.intel for all you ever want to know.

My question to this group is, has anyone analyzed the impact of this chip problem on satellite tracking software? I'm particularly interested in its affect on programs like Instant Track from AMSAT. I'd be very interested in any views on this issue.

Thanks,

2049. Satellite equipment

Newsgroup: rec.radio.amateur.space
Date: 1994-12-06 04:36:48 UTC
From: aelstien@wwa.com
Message-ID: <3c0pp0$htq@sashimi.wwa.com>
Source record: 26201
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment

I would like to find out which equipment is the best to buy for amateur satellite work. I am interested in the differences between the ICOM 820, Yaesu 736r, and kenwood 790. Also , what additional equipment is required? Are there many dx stations using satellite during this poor sun spot cycle period?

ThaNKS, 73, aL eLSTIEN

2050. time of NOAA-J LAunch?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-06 05:06:51 UTC
From: cdn@netcom.com
Message-ID: <cdnD0DI7F.EDK@netcom.com>
Source record: 26203

Does anyone know what time the launch of NOAA-J is scheduled for?
I have heard it it December 6, in the early AM.

TIA

I have been awarded the oppurtunity to participate in the Shuttle Amatuer Radio Experiment for the next shuttle flight but I have a major problem my operator that was initially going to handle the contacts can no longer participate and I need to find someone to handle it ASAP! Anyone in the Bradenton/Sarasota,FL area can you help me? Either by participating yourself or possibly put me in touch with someone localy. I really would like to make this happen, any help will be greatly appreciated. I need to know something by Tuesday afternoon 12/6/94 please send email or contact me by landline.

2053. Solar Radio Astronomy Help?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-06 19:58:31 UTC
From: rehm@slugbt.zso.dec.com
Message-ID: <3c2fp7$798@therag.zso.dec.com>
Source record: 26207

I'd like to build a simple solar receiver that would demonstrate
that the sun emits radio waves in addition to light and heat.

This project would be for use by 8th graders, and should
include a hand held (or camera-tripod mounted) directional
antenna. So, similar to turning your eyes or face away
from the sun (and it being less bright and less warm), I
would want the meter (or audio) indicator to decrease.

Further, it would be nice if the frequency used related to some
aspect of solar physics, i.e., some spectral line for H or He.

Finally, if possible, it would be nice to pick a frequency
at which reception could be correlated against some other
measure of solar activity (derived from WWV or some other
Internet-accessible solar report), so relative differences
in measurements across time could make sense.

I'm a home-brew QRP enthusiast with some radio astronomy experience,
so I would like to build this myself. Budget is $100 or so,
although if a general coverage Ham receiver could be used
with a down-converter, then the cost of the Ham receiver need
not be included.

Pointers to plans, schematics, books, helpers appreciated.

Thanks,

/eric rehm

Eric,

Although I don't have an answer to your question, your message caught my attention. My high school physics students will soon be choosing topics for their physics projects. I am trying to encourage them to collaborate with students at another school -- either by internet, packet radio or the microsatellites. If your kids get going on a solar physics project and they would like some high school "mentors" I think that would be a good experience for both groups of kids.

Last year, I had a group of students who tried to collect pulsar signals using Amsat's radio telescope in Colorado. They weren't successful but they learned a lot!

Good luck on you solar quest,

Bob Houghton KC6LVG

2056. Sound Blaster software on oak.oakland.edu - uploads.txt [1/1]

Newsgroup: rec.radio.amateur.space
Date: 1994-12-07 02:50:53 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3c37ud$ua@news.doit.wisc.edu>
Source record: 26210

I've just uploaded a bunch of sound blaster files to oak.oakland.edu.
They're currently in /pub/hamfiles/incoming but I'm sure they'll be moved
soon. Here's a list of the files:

APTCAP40.ZIP Capture weather sat photos with sound blaster card

FFTMORSE.ZIP Decode morse code with your sound blaster card.

MF12.ZIP Takes audio input from Sound Blaster card and displays
audio spectrum on computer monitor.

SBPSP11.ZIP Use your Sound Blaster card to receive weather photos
from NOAA weather satellites.

SBPMORSE.ZIP Decode morse code with your sound blaster card

SCOPTRAX.ZIP Real time audio oscilloscope for sound blaster.

SKY57A.ZIP SkyMap v 5.7 - a wonderful tool for VISUAL satellite
SKY57B.ZIP tracking. Draws "near publication quality" star maps
SKY57C.ZIP and plots satellite paths across them.

SLOWSC.ZIP Send and receive slow scan tv with your Sound Blaster card

SOP9445A.ZIP STS Orbit Plus. A BEAUTIFUL
SOP9445B.ZIP satellite tracking program. Draws earth globe and plots
SOP9445C.ZIP a satellite's path on it. Files A and B are the complete
set of files, U is an upgrade for those who are already
running an earlier version of the program.

2057. Mir is coming for Christmas! - chrismir.msg [1/1]

Newsgroup: rec.radio.amateur.space
Date: 1994-12-07 02:52:38 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3c381m$ua@news.doit.wisc.edu>
Source record: 26211

Just a heads up:

Mir begins a series of visible evening passes over North America this month. Most of us will have some excellent evening passes just before and after Christmas. Mir, the Space Shuttle and a couple of the "secret" recon satellites are the brightest objects in orbit. Mir looks like a very bright star moving across the sky. A typical pass is six to eight minutes long, from when you first see it until it disappears into the earth's shadow or fades out near the horizon.

I've found that people are VERY interested in knowing when and where to look to actually see Mir. I usually use tracking programs to look for good passes and plot them on star maps. Then I announce the times and where to look for the best passes on local 2-meter nets. We never fail to have several dozen people monitoring the repeater when pass time comes and everybody has a great time watching it. (And you can occasionally hear Mir on 145.55 while you watch it go over - an absolutely delightful experience!) You can hardly find a better way to introduce hams to hamsats.

If you'd like to try this, you'll need a tracking program that can calculate VISIBLE passes. To see a satellite, it not only has to be above your horizon, but the sun has to be down at your location while the satellite is still in sunlight above you. Most ham oriented tracking software only tells you when the satellite is above the horizon.

I normally use TrakSat 2.80 for most of my visual work. It shows orbits on a world map or on a star map. It can also output the data in text form (altitude, azimuth, range, etc) to a disk file. TrakSat 2.80 will work on XTs with Hercules monitors or better and if you have a slow computer you can let it chug away overnight, searching 30 days ahead and saving the results in a disk file you can read in the morning.

Once you've found a likely pass, it helps to plot Mir's path on a sky map. This lets you tell people things like, "Mir will pass through the bowl of the Big Dipper at 7:13 pm", which helps people find it.

If you decide to do this, I HIGHLY suggest you calculate and watch a few passes to get the hang of it before announcing it on the air. There are some pitfalls, such as a pass that looks great on paper, except that it's across the western sky and you're looking at the shadowed side of the space station, which makes it very dim and hard to see. Another problem is that Mir occasionally reboosts - fires its rockets to raise its orbit back up to where it should be. When

it does this, of course, your predictions are toast.

Another program is even better for finding visual passes if you can figure out its arcane menu structure. This is SkyMap and it plots "near publication quality" star maps and then plots the satellite's path across them. Once you figure out how to tell it to do so, that is. SkyMap also has a great search routine that finds future visible passes very quickly - again, if you can figure out how to do it.

Both programs are widely available on BBSes and can be found on the Clear Skies BBS in Madison, WI at (608) 249-7130. I've also just uploaded them to oak.oakland.edu. Look for these file names:

TrakSat: TRAK280A.ZIP, TRAK280B.ZIP
SkyMap: SKY57A.ZIP, SKY57B.ZIP, SKY57C.ZIP

If anybody has any questions, I'd be happy to help. Email me at djmullen@facstaff.wisc.edu.

Thanks and Merry Xmas,
Dave, N9LTD

2058. Re: SGP4/SDP4 C Library

>> of forward them.
>
>Not much luck though. I don't think there is a completed C library for
>SGP4/SDP4 at the moment, although Dr. Telso who wrote the Fortran and
>Pascal library mentioned there was such a plan.

i have had some moderate success in the past using the f2c fortran->C
converter. the main difficulty was with the deep-space routines;
various floating point exceptions. due, i suspect (guessing from prior
experience with getting the NEC to work) float/double size mismatches.
i was working to fix those, but got (as usual) side-tracked.

unfortunately, the output of f2c isn't very maintainable. you'll have
to keep the original fortran around... and the fortran itself isn't
very amenable to making something that accepts a pointer to a structure
that defines the element set (and any needed pre-computations) and a
time and returns a position/velocity.

> Turbo Pascal does not generate Object codes which you can link with a
> C program!

are you sure about this? the stack order is different for Pascal function
calls (from what little i still remember of MSDOG programming -- weekly
shock therapy has still yet to remove the last remaining memories...)
but that can be handled in C with some kind of kludge.

>So the next best thing to do is to the compile Pascal SGP4/SDP4 library
>into binaries (.EXE or .COM) and put the SGP4/SDP4 binaries resident in
>memory. Create some interrupt hooks to the resident SGP4/SDP4 functions
>which can be called from another (C or others) program.

... hair standing on end ...

>This is just what I plan to do with it.

or you can use Linux and retain some sanity. :-)

From: ys@isr.harvard.edu
Message-ID: <3c52al$nss@decaxp.harvard.edu>
Source record: 26216

Hi, I have a quick question about Instant-Track software. I would like to set time via NBS. Because the PC of our radio club uses comm port 2, I need to specify it in NBSCOM.INI file. Unfortunately somebody at our club deleted that file, I guess. The document does not really tell how to specify the comm port in this file. I am using version 1.00, and would very much appreciate it if anybody can help me out about how to set up NBSCOM.INI file. Thanks.

You've been saved from half of a horrible flaming by your disclaimer!

You are indeed correct that Borland compilers can link to Pascal
functions in external .obj files using appropriate syntax.
The problem is that Turbo Pascal doesn't create .obj files.
The original complaint made that pretty clear. Here's the other half
of the flame: Read before you write.

I am wondering the same thing. I was at HRO today and the 820H is $100 cheaper than the FT-736R. I use an FT-736R at school and I like the radio although some functions are far from intuitive. I still don't like the way the memories work. This radio has more features than the Icom but its older design (as reflected in no 9600 baud) is its biggest disadvantage.

I am tempted to buy the Icom beacuse of its advertised 9600 bps "plug and play" and its smaller size. I don't want to shell out my cash until iv'e heard from some users. I am primarily interested in working the microsats, both 9600 bps fm and 1200 PSK. Although the Yeasu will do 9600 after mods, the thought of paying almost $2k for a radio and then wiggling capacitors until they break off and the like doesn't appeal to me.

If anyone reading this is using any of the three radios mentioned above, I'd love to hear what you like / dislike about your radio as well as your other equipment and modes that you work.

It has been delayed until Dec. 12 at 10:02 UTC (05:02 EST, 02:02 PST).

The launch on Dec. 6 was scrubbed due to a faulty ignighter in the
Atlas launch vehicle, and the re-scheduled launch on Dec. 7 was scrubbed
due to high winds.

There is a short test program called "p87test" that is available on the
comp.sys.intel newsgroup, or by ftp, that will evaluate your pentium
chip. I ran the program on my machine last night. Here's the output
of the program:

Pentium FDIV bug finder. (c) Terje Mathisen 1994

This is a Pentium or better cpu

CPUID reports back:
Vendor id = "GenuineIntel"
Family (4=486, 5=Pentium etc.) = 05, stepping = 05, model = 01

CPU feature list:
1 : FPU (NDP) onchip
2 : Virtual 86 Mode Extensions
4 : I/O Breakpoints
8 : Page Size Extensions
10 : Time Stamp Counter
20 : Pentium stype MSRs
80 : Machine Check Exception
100 : CMPXCHG8B instruction available
It has a 387 or later ndp

It has the FDIV bug:
(1.0/824633702449.0)*824633702449.0 is not equal to 1.0!

(end)

Intel has promised me a replacement chip. When? Who knows!

2071. pctrk304.zip - 3D Earth satellite orbit visualization package

Newsgroup: rec.radio.amateur.space
Date: 1994-12-08 18:21:04 UTC
From: 71371.1257@CompuServe.COM
Message-ID: <9412081821.kp16322@SimTel.Coast.NET>
Source record: 26225
Cross-posted to: comp.archives.msdos.announce,rec.radio.amateur.space

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/satelite/
pctrk304.zip 3D Earth satellite orbit visualization package

PC-TRACK 3.0 is a 3D object-oriented, windowed package for the
visualization of earth orbiting satellites. Computes and displays
position information for up to 200 satellites simultaneously on either 3D
ECF projections, or a Mercator projection of the world. Shows satellite
footprints, lines of sight between site and vehicles, satellite and
sub-satellite positions, as well as solar position. Displays look angle
data in graphical and chart form.

PC-Track has an integrated mutual visibility pass scan capability for
finding future in-range passes simultaneously visible to one or two
sites. Finds illuminated satellite passes for times of interest.

Text mode tracking computes satellite position, doppler shifted
frequencies, orbit phase, range and range rates, and look angles for
two sites simultaneously, as well as solar illumination data.

PC-TRACK 3.0 has the capability of saving all operating parameters
(active satellites, and satellites, graphics views, display modes,
colors, etc.) in separate parameter files. This permits the user to
build many different track scenarios, each quickly loaded from the
program. Four sample parameter files are provided: AMATEUR, WEATHER,
GPS, and DEFAULT.

PC-TRACK 3.0 is capable of importing data from NORAD Two-Line element
files, AMSAT element files, and OBJECTS.DAT and OBSERVER.DAT files from
earlier versions of PC-TRACK.

PC-TRACK 3.0 runs in DOS protected mode to take advantage of up to 16 MB
of system RAM. (NO 640K BARRIER!)

Program Requirements:
80386, 80486, (&Pentium?) CPU (80387. recommended. not reqd).
2-16 MB
3 MB Disk space
DOS 5.0 or later.

PC-TRACK is ShareWare, registration required. Registrations by Visa & MC
now possible via FAX. Corporate/Government POs welcome.

Program Limitations: Distribution versions comes with four globe views. Registered users receive MAPGEN, a graphical globe view generation utility which allows generation of an unlimited number of user defined views. User can define viewpoint, offset, scale, attributes (such as geographic features), and colors for each view.

Changes: Program and documentation reflect authors new address and phone; new registration options (VISA/MC, FAX orders, Email orders, etc.); updated CPU platforms, several bug fixes and typo corrections.

pctrk304.zip has replaced pctrk30b.zip and pctrk30a.zip.

Uploaded by the author.

I use the 736r and it seems to be the workhorse of the satellite
crowd. It is quite an easy and intuitive radio to use. I guess I
don't understand your comment about the memories. You might not
know a trick that is not documented in the English manual.
To load a memory to a VFO without affecting the memory, as it
would be if you did a memory exchange, you do the following.
Select the appropriate more ie satellite reverse or normal.
Press MR, select the memory you want to load to VFO. Then you
press the FN key and then the VFO key. The memory contents
are loaded into the VFO and the memory is not affected. I have
my OSCAR memories set up to tune up. My frequencies are in the
CW bandpass and transmit is set to CW receive to USB. Thus all
I have to do is turn on the VOX and tune the transmit frequency
till I can hear my CW on the downlink. Actually I leave the satellite
selector switch in the transmit position during the memory VFO loading
process as saving one step. I can be loaded and tuned in seconds.
Usually I am ready before the KCT has positioned the antennas.
The big advantage of the 736r is the two modules you can add. I like
to work 6 meters when there is not a satellite window. The Icom is
smaller if that matters to you. The 9600 is a non-issue. The mods to
the 736r are easy but you should also change the IF filter. I am
currently trying a IC-281H for the 9600 birds and I will post my
success or lack of same. Good luck 73 de Jerry

Hi Eric, about building a solar radio receiver. I don't know what frequencies you would need to listen to to hear Hydrogen or other emissions but as a UK amateur who does a bit of Moon bounce I have done some reading about radio astronomy. You would find it hard to hear much solar noise on a VHF receiver with only a small antenna unless there was a lot of activity at the time.

The easiest and cheapest way to hear a significant amount of noise would be to use a VHF converter in conjunction with an HF receiver and build a 'Dicke' system. This is where you subtract the receiver noise by connecting two antennas to the receiver via a phase shift switch. The two antennas, which only need be small, like a dipole or perhaps a dipole with one reflector behind, have their cables combined. As the noise source (the Sun) is moving with respect to the antennas the signals received by the antennas will alternately combine and cancel as the distance from the Sun changes by half a wavelength. If you now introduce the phase switch which effectively switches in and out another half wavelength of cable into the feed from one of the antennas every 0.001 of a second (easier than it sounds). You also reverse the polarity of the output from the detector at the same rate. Bingo, you've removed the receiver noise completely.

As the noise from the receiver is likely to be something like 300 times as loud as quiet Sun the amount of noise you will get from doing this is VERY significantly greater than you can with just a small antenna and a straight forward receiver.

In summary you would need: A VHF down converter to plug into an HF receiver, the ability to get at the detector circuit in the receiver, should not be difficult for a QRPer, and two small antennas. The phase shift switch is very easy to build, just a handful of components, including the square wave generator to do the 0.001 second switching.

To get results you may need to wait and see what difference in noise you get as the Sun comes round from East to West passing through the beam width of the antennas, or you could switch out both antennas and switch in a 50 Ohm resistor on each end to get a 'cold sky' reference.

I don't know much about the subject and this is just stuff I've read and fiddled about with while I've been dabbling with VHF Moon bounce.

Need to talk more then mail me: mike_ray@cix.compulink.co.uk

My call sign is G4XBF.

73, Mike

>the lastest and greatest if available. Does any nice person have their
>phone number (the documention doesn't list it.) Thanks! - Chris

That is the latest version available from LL Grace. There is another floating
around, which was authored by someone else.

The latest greatest, though, is the Windows KCT Driver by David Hoatson. If
your computer has Windows, this and Wisp is the way to go by far!

>like to set time via NBS. Because the PC of our radio club uses
>comm port 2, I need to specify it in NBSCOM.INI file. Unfortunately
>somebody at our club deleted that file, I guess. <etc. etc.>

Here is what is in the version I have:

```
# This file contains parameters which control how we dial up the NBS ACTS
# The dial and hangup commands are the exact character strings we will use
# to make the modem dial and hangup. You may customize these for your
# modem. port tells us which serial port to use. 0 is COM1, etc.
# maxtime sets the maximum time (seconds) for a phone call.
#
#
port = 0
baud = 1200
dial = ATDT1-303-494-4774
hangup = ATH
maxtime = 0
```

This should do it for you!

It is possible to do it through AO-27, but not many would appreciate the packet use of the FM repeater here. APRS was originally supposed to be useable through sats, but it has not been implemented for the Pacsats, which use a very good store and forward BBS system that is very much advanced from the current ground-bound systems. I am hoping to find a way to do an APRS-like system through the Pacsats in the future for a trip to Hawaii, but so far nothing.

>I'm messing around with APRS, but never hear anyone.. Guess I should

The original APRS documentation suggests beaconing your APRS data
through Mir's TNC on 145.55 MHz. I've never seen anybody try this,
but it sounds like fun.

>Just checking. What is the best mmdb rig for satellite comms I am leaning
>towards the new icom has anyone used this puppy yet?

I have, and I am not thrilled at all. For the money, the FT-736R is still a far better buy. It is only about $100.00, but it includes an onboard power supply, so the costs are actually even.

The Icom boasts 9600 capability, but this does not work for satellite use. They made it with two receivers, and the one that the satellite mode uses does not have the 9600 capability.

On voice sats, I have found that fine tuning is a real pain. A button must be held down while tuning, and if you are transmitting at the time and tuning your uplink, you need three hands.

As a satellite rig, it was not well thought out. I bought it because I will be using it on my boat for 1200 baud pacsats, and I could not find the room for the 736s larger footprint. I sure wish I could have!

See-Ya-Bye!

Yes, you do. FYI, the 736 has VOX built in, and the controls are on the front,
not buried in the back of the radio. Is anyone alive at Icom???

> dec@netnet.net

The above message is woefully incomplete and misleading. G3RUH's review can be summarized 1) Icom's selling the IC-820 to the satellite crowd where the Yaesu 736 dominates and the IC-820 is not a Yaesu clone, and 2) the IC-820 is one of the best packet performers for single band use, out of the box it does not operate split UHF/VHF via the rear panel accessory jack.

Icom could stand to learn a few things about user interfaces. On the other hand my Icom IC-736 (not Yaesu) demonstrates that Icom does know how to build an intuitive user interface. Maybe I'll trade my IC-820 when Icom builds one into the same chasis they use for the 736, 737, and 738.

Worst gripe about the IC-820? It didn't come with a microphone. Now Icom is running a promotional for Christmas where they ship an external vox. Wonder if you still have to provide your own mic?

WiSP requires a propper Windows driver. Using ITRACK etc, won't
really work. I know that a driver is being written for the
SatTracker, but I am not sure of the current status.

From: arbee@teleport.com
Message-ID: <3ceub3$992@kelly.teleport.com>
Source record: 26248

Howdy all!

The 12/11/94 04:54:00 PST pass of the MIR over the Pacific Northwest was heard load and clear, towards the tail end of the pass the packet bursts stopped and were replaced by the voice of a cosmonaut! He was calling for "Dave" N6???, I have not heard a voice pass since this time last year..

Question: Who are the cosmonauts currently on the MIR, what are their call signs (and names?) Also, is it acceptable to attempt a QSO with a cosmonaut by calling R0MIR, if you don't know the calls of the individule comonauts?

Thanks for your input!

I once ran across a text file on a packet BBS that had the KEP elements for about 150 sats, does anyone happen to have current (or even slightly old) elements for stas other than those normally found on here and on packet (OSCARs, NOAA, Television etc).. I don't need them for anything in particular, just interesting to check out now and again..

Thaks for posting what you have, if you have.. :)

Haven't done an analysis because I track very well with 486/33.
My gut reaction though is that this hobbyist needs more accuracy
than Intel thinks. An accurate Epoch Date/Time requires a few
decimal places. Accurate to 10 minutes won't work... accurate
to 10 seconds is barely tolerable. I need to know where it IS,
not where it was!

I've long ago lost track of who is on board. When in doubt, use the same call as what you see on packet. Due to power problems, the use of the amateur equipment has been drastically curtailed. As they rectify the problems, it should be getting used more and more.

2106. multi mode dual band for satellites?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-12 21:40:47 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9412121540.ZM20615@SALCIUS2>
Source record: 26258

Save $1000 or so, and look for a used Yaesu FT-726R It must have the satellite option board, otherwise you can't operate full duplex. I got mine for $800 with the satellite board and HF module. The HF module is hard to find, though. It puts out 10W (all modes) on 10, 12, and 15 meters.

It only has 10 simplex memories, no duplex memories. And you have to tune the transmit and receive frequencies separately, but that is not really a problem when operating AO-13 or AO-10. For the PacSats you can use a Kansas City Tracker or Trakbox to auto tune using the up-down lines on the microphone connector.

The FT-726R only puts out 10 watts, but 25 watts from the FT-736R is still not enough for reliable operation on AO-13 or AO-10. Most people run 50-100 watts.

One disadvantage of the FT-726R is that there is no 1270 MHz module available. If you want 1270 MHz (for Phase 3D) you need the FT-736R and the $600 module. I plan to get a transmit converter for 1270 MHz operation on Phase 3D, since this is an "uplink only" band.

I took a disk with InstantTrack to my local dealer friend, and used a 90 mHz Pentium next to a 486-66 to see the difference. The older the elements, the greater the error, which is to be expected. The more the calculations, the more the errors. It looked like if the Keps were more than a day or two old, you are out of luck with the Bugium. One way or another, if you have one of these, get the replacement. Bugs should NEVER be tolerated!

If it were a car, it would have been recalled immediately.

Eric,

There is not really a simple solution. May be the smallest system is
to use an 8meter long yagi on 2m or 70cm, fix its direction, have a
low noise preamp and record the output as the sun wanders through the
main antenna lobe.
An alternative might be a TVRO dish and a low noise amp in the microwave range.

Both solutions may be put up for little money, but these are not *small*
antennas.

Good Luck, Moritz DL5UH

2110. Meteor Skeds ???

Newsgroup: rec.radio.amateur.space
Date: 1994-12-13 14:09:29 UTC
From: nu-way@ic.net
Message-ID: <3ck9uq$fgs@condor.ic.net>
Source record: 26064

Anyone want to try a meteor SKED tonite? The peak of the Geminids shower is predicted to be around 0500Z 12/14. I'm looking SSE to SSW from EN82gt (NW of Detroit, MI).

I have a SKED on 144.143 at 0300Z - 0320Z. Available anytime after that.

CALL: WD8BKM
GRID: EN82gt
NAME: Tom

Please reply via e-mail to nu-way@ic.net. Reply with call, grid, time, procedure (1st & 3rd, 2nd & 4th).

73, Tom.

2111. PSK and 9600 Baud Modem Wanted

Newsgroup: rec.radio.amateur.space
Date: 1994-12-13 20:36:48 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3cl12k$8qc@newshost.lanl.gov>
Source record: 26065
Cross-posted to: rec.radio.swap,rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Someone posted to one of these groups looking for a PSK modem
and possibly a 9600 baud modem. I seem to have lost the post but
I have a PacComm PSK-1 and NB-9600 along with the associated cables
power supplies etc. I am strongly leaning to the TAPR DSP kit as a
project making these modems surplus. If you are the person looking for
these modems drop me an e-mail and we can discuss a deal.

Try the sci.space.shuttle newsgroup -- you should find answers there.
The space calendar is also posted monthly to sci.space.policy at least,
and I think to sci.space.news.

Message-ID: <1994Dec13.223111.8338@ultb.isc.rit.edu>
Source record: 26066

I am just getting started with packet, and satelite tracking. I would
like to know where I can find a list of sats I can listen to (i.e. not
necessarily for HAM) and all the amature satelites. I have the Keps for
the amature and weather sats from ftp.amsat.org, but I want descriptions
of each satelite and the TRANSPONDER frequencies of EACH. Thanks!

From: roffer@rcf.rsmas.miami.edu
Message-ID: <3cllhi$ome@umigw.miami.edu>
Source record: 26068

We have experienced problems with navigation based on TBUS
elements using a Pentium based system. We have ordered a
new, corrected chip, from Intel and will have to wait
a month for it. While I do not know for sure that our
odd behavior is due to this, but I suspect it is.

The Amsat Journal has not published this article.
There was an article entitled, "Icom's IC-820H A
Satellite user's perspective" in the Oscar News
from Amsat-UK, August 1994, page 3.

The ftp part may be accurate.

I was watching NASA-SELECT TV this morning at 4am eastern.
They had live coverage oc the NOAA-J launch. There was a hold
at about 4:04 am and I had to leave so I missed the rest. There
was a problem with something related to a gyro. Launch time was
set at 4:02 am eastern with a 10 min window. Did they get it off
in the window?

I've seen letting the sun drift past a fixed yagi given as a good test
of a low noise pre-amp. If it's working right, you should see a definite
increase in noise as the sun drifts through the antenna's beam pattern.

Everybody with a TVRO dish gets a demo of the sun's microwave RF energy
twice a year when the Clark belt gets between the earth and the sun and
the sun's microwve energy drowns out the much weaker signals coming
from the satellites. These events are called sun outages and they're
regularly announced.by the various satellite and cable companies.

2120. Shuttle Launch Schedule - 95 - shutmanf.msg [1/1]

Newsgroup: rec.radio.amateur.space
Date: 1994-12-14 13:24:56 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3cmrn8$38k@news.doit.wisc.edu>
Source record: 26073

In answer to a request for a schedule of shuttle launches in 95 - I found
this on sci.space.shuttle.

From: steven@igor.Levels.UniSA.Edu.Au (Steven Pietrobon)
Newsgroups: sci.space.shuttle
Subject: Unofficial Space Shuttle Manifest (Dec 1994)
Date: 1 Dec 1994 04:30:33 GMT
Organization: University of South Australia
Lines: 250
Sender: steven@igor (Steven Pietrobon)
Distribution: world
Expires: 31 Dec 1994 23:59:59 GMT
Message-ID: <3bjjh9$l5q@vail.levels.unisa.edu.au>
Reply-To: steven@spri.levels.unisa.edu.au
NNTP-Posting-Host: igor.levels.unisa.edu.au

Rev 25 Nov 1994

The following is the Unofficial Space Shuttle Manifest. This file gives the
launch dates, orbiter, and payloads for upcoming shuttle launches. The launch
time and orbit parameters are also given where available. Note that the launch
date and time are officially set about two weeks before launch at the Flight
Readiness Review (which usually selects the date and time in the manifest).
The manifest is also subject to a lot of shuffling and date changing (which
leads to the STS numbers not being in order) so beware when planning to see a
shuttle launch.

Please send changes and updates to:

Steven S. Pietrobon, Australian Space Centre for Signal Processing
Signal Processing Research Institute, University of South Australia
The Levels, SA 5095, Australia. steven@spri.levels.unisa.edu.au

Current versions of the Unofficial Space Shuttle Manifest (this file) and
Unofficial Space Shuttle Launch Guide (for detailed information on how to see
a shuttle launch) can be found by anonymous ftp to audrey.levels.unisa.edu.au
in directory space in files shuttle.man and shuttle.txt, respectively.

Current and previous versions of these files can also be obtained by anonynmous
ftp to explorer.arc.nasa.gov (128.102.32.18) in directory /pub/SPACE/MANIFEST
in files manifest and launchpass. The shuttle press kit is also available in
directory /pub/SPACE/PRESS.KIT and is usually available about a week before
launch.

For the latest and greatest information call the following:

1 800 572 4636 - Visitor Information Center information and next launch.
1 800 KSC INFO Florida 1 800 number. Florida only information thanks to
Richard F. Jones (rfj@alpha.sunquest.com)
(407) 867 4636 - Space shuttle mission information.
(407) 867 2525 - Space shuttle launch preparations.
(407) 867 3900 - Space shuttle status line. Technical, lots of TLA's. Just
remember, we warned you.

You can also:

finger @calvin.ksc.nasa.gov or finger @128.159.104.72
finger nasanews@space.mit.edu

Abbreviations used in manifest:

STS - (Space Transportation System) number of the flight. The STS numbers are
not in order due to delays in some missions and changes in schedule once an
STS number has been assigned.

Date - Day Month Year - dd mm yy (Note that most launches are on Thursday.)

Time - Earliest launch time. The "S" means "U.S. Eastern Standard Time" and "D"
means "U.S. Eastern Daylight Time".

Window h:mm - The time frame, in hours:minutes, available for launch that day.
Some windows have "COLAs" (Collision Avoidance) during the window when the
shuttle cannot launch.

Inc. deg. - Inclination of the orbit in degrees when the shuttle is launched.

Alt. km - Altitude in kilometres.
1 nautical mile = 1.852 km (exactly), 1 statute mile = 1.609344 km (exactly),
1000 feet = 304.8 m (exactly). (I wish NASA would use ONE unit for distance :-)

The abbreviations for the Orbiter names are
Col Columbia (OV-102)
Dis Discovery (OV-103)
Atl Atlantis (OV-104)
End Endeavour (OV-105)

Payload - Payloads in the cargo bay that are being launched.

Launch was scrubbed apparently due to problems with the booster.
Rescheduled now for Dec 20 at 5:05 PST I believe. At least the

I am wondering if anyone in this newsgroup has operated the microsats using a Macintosh computer, either by using PB/PG or WISP through an emulator such as SoftWindows or SoftPC or by using software specifically written for the Mac. I am currently working Pacsat and Lusat at my school using WISP running on a 486DX/33. I want to set up a ground station at home but don't want to buy an additional computer just so that I can play satellite.

If you can't answer my first question, I'd like to hear of *any* experiences, good or bad, running DOS or Windows programs on a Mac or PowerPC.

Thanks and 73,

Bob Houghton KC6LVG

I have seen it, and it isn't pretty. Wisp, especially, is very demanding
on a system, and these emulators are slow. If you do this, use a Track
Box for the tracking. It is essentially standalone, and makes no real
demands of the host computer. It does require its own serial port.

2128. MIR voice cntct foiled by jerk!

Newsgroup: rec.radio.amateur.space
Date: 1994-12-15 13:16:33 UTC
From: arbee@teleport.com
Message-ID: <3cpfji$qp2@elaine.teleport.com>
Source record: 26082

For nearly two years I have been trying to work the MIR on a voice pass, I have worked it on packet about a zillion times, but really really wanted a confirmed voice contact. Well, this morning at about 4:30am I was writing a letter in another newsgroup when I heard the familiar sound of packet bursts on 145.550, I reached over to my other computer and booted up Instatrack, sure enough, there was the MIR.. A moment later came the sound I had been waiting for, CQ CQ in a decidely Russian accent! I scooted over to the mic and reponded with R0MIR this is KB7VZL, how do you copy? KB7VZL I copy you very clear, what is your name? My name is John, I'm located on the west coast of the United States in Salem, Oregon. How are you this morning? I asked.. Hello John I am BLEEEEEEEEP BLEEEEEEEEEEEP BLEEEEEEEEEP!

ACK!!! Packet tones!! Local packet tones!! Some jerk was trying to connect to the MIR packet station while I was talking to the Cosmonaut!! The packet continued for the entire pass and about 10 minutes after.. Several attempts to get the person on packet to go voice failed.. I believe this was an un-attended packet station which was acting on a script file, a very simple thing to do and a very very RUDE thing to do!

If you are new to packet, resist all temptation to write a script file to connect your terminal to the MIR pbbs, at the VERY LEAST be present and monitoring the MIR freq in case someone else is on the pbbs or VOICE with the cosmonaut!!!

If you operate an unattended packet station on 145.550, I hope lightning strikes your antenna! Gawd I'm mad.

John KB7VZL

I have run (on a Quadra 700) with SoftPC with Windows, both PB/PG and Wisp.
There are problems with PG (it needs an active DCD line). I used PG_AEA
with my AEA DSP-2232 with no problems. Windows is such a dog that Wisp use
was not successful. I added the DOS Compatibility Card (486SX/25) and Wisp
works great.

You will need some antenna tracking hardware/software (I wrote my own for
the Mac).

Put your TNC in traceon and passallon modes and listen you should
get the call of the offending station that way. Perhaps a gentle
explanation of his sins will cause a change in ways if not pin
his coax. We had a guy on local packet with the call "nocall".
He just didn't know how to set up the TNC and apparently didn't
have anyone to ask he was a bit harder to track. Good luck 73 Jerry

2135. Locking on to pacsats with TAPR modem.

Newsgroup: rec.radio.amateur.space
Date: 1994-12-15 22:55:48 UTC
From: wk@muscle.frc.maf.govt.nz
Message-ID: <WK.94Dec16115548@muscle.frc.maf.govt.nz>
Source record: 26089

Thanks for reading this note. I have noticed that my kitset TAPR PSK modem has trouble locking on to the 1200 bps PSK sats.

In particular with AO16 there are 3 ways to tune into the signal causing the TAPR modem PLL circuit to lock. With attended operation, this is not much of a problem, I disable the AFC, fiddle the tuning control until the buzz sounds right and the PLL has captured the 1600 Hz carrier, flick the AFC back and all is sweet.

When unattended however, I leave the downlink RX 3 kHz below the AOS frequency, the sat pops up, dopplers down, the modem captures the carrier tone wrongly (too high) and tracks it all the way down to LOS without copying a single frame.

Could this have something to do with the fact AO16 uses raised cosine (how does this work anyway, what are the benefits?) IO26 does not have this problem of multiple lock points, but LO19 has, although to a lesser degree than AO16. Also, LO19 can be copied with half an S unit less than AO16 and as far as I am aware does not use raised cosine. Any suggestions on how to fix this problem are appreciated.

This is normal. The nature of PSK is that there are quite a few signals
that the modem can lock on to, but only one is the right one. Raised
Cosine helps this to some extent by reducing the unwanted signals some,
but they are still there.

The best way to deal with this is to pre-tune the radio to the right
frequency before the pass. The Kansas City Tracker and Track Box will
both do this, as well as allow for the tuning inputs during the pass to
keep it in lock. These have the benefit of also tuning the uplink
frequency, which helps quite a bit.

Or, you can simply tune the receiver yourself at the beginning of each
pass.

This sounds familiar! I have an 820 for my boat, and a 736 at home. The
Yaesu is definitely superior for Sat use, and a lot better buy, as well,
with the built in power supply.

Wisp works very good on the platform it was designed for.

>You will need some antenna tracking hardware/software (I wrote my own for
>the Mac).

The Track Box uses only a serial port. If the Card you mentioned can access it, it will work very goos with Wisp, which has its own tracking and scheduling that is far superior to any others available.

Does this greatest one handle azimuth rotation over the one full turn that is limiting the use of the KCT? I mean, many azimuth rotator systems like the Yaesu G1000S have an overlap of 90 degrees, but it's useless in automated tracking because the driver program doesn't recognize it.

> experiences, good or bad, running DOS or Windows programs on a Mac or
> PowerPC.

Well, SoftWindows seems to work on my PowerMacintosh 8100. I've run
Solitaire and Mine Sweeeper. Then dug up a 1987 edition of Norton SI
and got a 47.1 rating. Interesting when my 486DX33 rates 50 with the
same code.

Also I have run "rawrite.exe" under SoftPC in order to create Linux
bootdisks. Now the PC has a real operating system.

The 8100 appears to emulate 68k code 3x faster than my 33 MHz 68030
Macintosh IIvx ran native. My PCB fat binary autorouter runs 30x faster
native PowerMac than native 68k. I'm impressed. My Mac IIvx will get
a 7100 upgrade early next year.

Intel has officially annouced problems with their Pentium
Microprocessors. It seems that they cannot perform floating-point
division correctly. It isn't the video it's NEW MATH! ;)

Joke heard recently...

Why didn't Intel call the Pentium a 586?

Because they added 486 + 100 and got 585.99999275439!

Mir operates as R0MIR on 145.55 SIMPLEX. THe Shuttle, when it's carrying
SAREX uplinks packet on 144.49, and voice on 144.91, .93, .95, .97, and .99...
random selection of uplinks, with the downlink continuing on 145.55.

When the SAREX gear is on in Packet Robot Mode, it's callsign is W5RRR-1.

We sould suggest you keep the retries count down, and just keep reinitiating
it if necessary. Also: It's _not_ necessary to get multiple contacts. One's
plenty for the QSL, per mission. Please let the others try to get their
confirmation.

During the September mission, I copied direct voice and packet from the shuttle. I sent in listening reports to the ARRL (who was supposed to be handling the SWL & QSLs), and I still haven't gotten my confirmation. I included a SASE, and in fact sent two separate SWL reports.

Has anybody else received QSLs or SWL confirmations for that mission? Am I wrong in thinking that an SWL rates a confirmation?

How long might it be before these confirmations come out?

Thanks & 73! de kb8cne

SatTrak IV, a standalone tracker/tuner will also work.
It has WiSP support built-in etc.

Contact Kiron Corp 614-481-0542
or me: w8gus@amsat.org will do.

Ron.

This has been discussed on amsat-bb@amsat.org.
Contact w0sl@amsat.org (Roy) who is gathering
information. Some people report no problem.
Others do.
Ron w8gus.

2154. Where am I?

This may or may not be a good place to ask this, but it's sort of satellite related... Does anyone know of a celestial navigation program either on the market or available via FTP?

Please email, as it is not always easy to check news from this part of the world...

Thanks,
Brent

I will post and e-mail this reply: The newsgroup rec.boats is a good place to ask.

2158. APT-Satellites: Report DEC 17, 1994

Newsgroup: rec.radio.amateur.space
Date: 1994-12-19 08:21:38 UTC
From: peter.henne@gmd.de
Message-ID: <peter.henne-191294092110@oskar.gmd.de>
Source record: 26262

```
Observed 50.61 deg NLat, 7.55 deg ELon; DEC 17, 1994

Following the satellite-name you read the approx.
hour (local=sun-time) and motion-direction of the
pass (N=northbound, S=southbound).
This time +/-1.5h is valid for the next 10+ days
to expect the satellite to be visible in range of
northern-hemisphere-stations, add 11h and switch
S<->N for another pass to observe.

NOAA-9 10:S APT 137.62 MHz On
NOAA-10 17:N APT 137.50 MHz *OFF*
NOAA-11 16:N APT 137.62 MHz AVHRR dead
NOAA-12 18:N APT 137.50 MHz On
Meteor 2-21 10:S APT 137.85 MHz On
Meteor 3-5 18:N APT 137.85 MHz *OFF*
OKEAN 1-7 09:N APT 137.40 MHz *OFF*

APT of OKEAN 1-7 was off during all available
passes. NOAA-11 imaging is dead, burst and timing
signals are active. Meteor 2-21 is the only active
russian APT-bird, signal is weak (antenna-boom not
deployed?). NOAA-10 is in standby-mode, no APT. No
other APT-signal 136.00-137.99 MHz 07:30-20:00 UT.
Lauch of NOAA-J is delayed until DEC 28.

"Numbers...are distorted" ???

In <3cssld$giv@news.u.washington.edu>,
jhulten@saul2.u.washington.edu (Jeffrey Hulten) writes:
> Intel has officially annouced problems with their Pentium
> Microprocessors. It seems that they cannot perform floating-point

Just for accuracy's sake, Pentiums (Pentia?) *can* do floating-point
division correctly. Unfortunately, they also can do it wrong.
Specific divisors cause the CPU to use incorrect entries in a lookup
table, a problem that has already been fixed in the chips now being
manufactured.

I see your smiley, but I have to say it anyway: The Pentium Flaw (tm)
(Intel insist it's a Flaw, not a Bug) should not have anything to do
with distorted video. I've never heard of a video driver that used
floating point calculations.

2162. Microsats via Internet???

Newsgroup: rec.radio.amateur.space
Date: 1994-12-19 19:42:38 UTC
From: exuward@exu.ericsson.se
Message-ID: <3d4nne$9ud@cnn.exu.ericsson.se>
Source record: 26264

I'm not a ham, but my dad is. He spends a lot of time at sea around Guam and Saipan. He has a tracking system set-up and communicates regularly with these Microsats.

My question is... Is there a tracking system with a gateway to the internet? Something that might download all the files out of the satellite's queue. Look for some code that meant the file was an e-mail message and who the recipient was, then mail it. Likewise you could mail to some station's e-mail address, embed a call-sign and satellite in the subject. Next time the satellite passes over, your message would be uploaded.

If nothing like this exists, it sounds like a fun project that I'd like to work on.

Jerry,
You need to locate one of the packet satellite gateway stations,
you dad should be able to do that. Then have them set up a routiong
table for messages between your dad and your mail account. The Packet /
Internet gateway in that area would handle routing the message to E-mail
once the Satellite staiton downloads the message.

Hi Ron,

Do you know where I can get a procedure on how to do this? I don't
think my dad knows how to locate a gateway. At sea, he's not in the normal
packet radio range so I don't know if there is anything in the "area".
He has a station and usually gets on ko-23, ko-25, ao-13, ao-20, and
some others.

Thanks,

Jerry.

2168. Need help w/ satellites

Newsgroup: rec.radio.amateur.space
Date: 1994-12-21 04:08:49 UTC
From: guarinoj@aspen.uml.edu
Message-ID: <1994Dec20.230849.1@aspen.uml.edu>
Source record: 26275

Would someone mind telling me how exactly one can track a satellite with a computer?
Use an outside satellite dish?
I dont know, but am interested in how this goes about happening..
Please emial at
Guarinoj@woods.uml.edu

also what are the benefits of amature satellite tracking?

thanks again?

2170. Keps for KO-25

Newsgroup: rec.radio.amateur.space
Date: 1994-12-21 13:21:42 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.161.788015973@UPEI.CA>
Source record: 26283

Hi - With the recent decision to drop the old KO-25 assignment - I have a question as to the recent W1AW posting where it has KO-25 and KO-25? Which has the updated keps for the object now assumed to be KO-25?

Also - on archive.afit.af.mil - in amateur.tle - is the KO-25 kep listing for the object now assumed to be KO-25 OR is the data associated with the older object previously assumed to be KO-25.

The reason I ask is that I obtain my keps from archive..... and have in the past updated the KO-25 data from the arrl data.

Please send replies to seeler@upei.ca

Arthur Chandler (arthurc@crl.com) wrote:
: Greetings! Hope folks here can help me/us out:
: My son has an Icom 2mm/70cm handheld, a packet modem and a Macintosh
: computer with an Internet connection.
: What, in your view, is the minumum equipment he will need to purchase
: and/or download to have a satisfying experience with satellite tracking --
: voice and/or packet?
: Email or post = much appreciated!

Step 1: Go to the archives and download a satellite tracking program, not being a Mac person I don't know what avaiable but I know they are available.

Step 2: Get a new set of KEMPS, this news group carries them on a weekley basis or you can get them from the AMSAT, ARRL or the Soruce NASA.

Step 3: You can listen to Dove-17 on 2M FM and decode the packet beacons and listen to the voice. AO-20 or 21, I don't have my notes, Sometimes operates in a FM crossband repeater mode. I have worked it from my pickup while running down the road. There are some packet satellites that operate in regular 1200 baud FM, though most operate at 9600 baud PSK which requires a different radio than a HT.

Step 4: Here's the big step: Purchase 2m and 430 All mode Radios, I have a Yeasu, but Kenwood and Icom build them too. Purchase an "Oscar" packe dual Band Antenna system, I have the KLM, for Cushcraft and others build simular antennas, Then get an AZ/EL rotator to point the antennas. This is the basic system, Add Amplifiers of needed and a Computer/Rotator controler to auto track the bird and it becomes a real joy to operate the birds.

2172. PACSAT info sources and software

Newsgroup: rec.radio.amateur.space
Date: 1994-12-21 17:47:38 UTC
From: lsn92@ecs.soton.ac.uk
Message-ID: <28819.9412211747@vermeer.ecs.soton.ac.uk>
Source record: 26273
Body handling: HTML body converted to readable text

Hi there,

I am looking for the latest PACSAT related information sources. Are
there any ftp site or web pages or email addresses for this matter?

I am new to packet radio communications to start with. But I am
interested in collected data from the PACSATs. So I wish to find out the
answers for the following basic questions:

1. Are these satellites PACSAT? UO-22, KO-23, KO-25, PO-28.
I am interested in these because they have FM downlink and is very
easy to track. Are there anymore PACSAT not listed above?
Or do all PACSAT have FM downlink at 9600 baud by definition?

2. I read the PACSAT documentation which was produced University of
Surrey a few years ago. It briefly mentioned UO-14 and UO-22. I
understand that these PACSATs worked in two mode: File Server and
Broadcast. I am interested in Broadcast specifically. I would like to
know if anybody has experience in working with the Broadcast mode of
these PACSATs.
Do KO-23 and KO-25 have the same Broadcast mode?

3. What I plan to do is to write a program for automatic collection of
the broadcast frames from the PACSATs. I understand that each broadcast
frame looks something like this:

0xbb

The procedures of my program are:

collect all broadcast frames from the PACSAT
save all the frames in a temporary file

process the temporary file
sort the frames
restore the PACSAT files
extract 'original' files from the PACSAT files

Has anyone written any programs or algorithms for all or part of the
procedures?

I understand that Surrey produced a program called PB. I would like to
be able to track and download frames from multiple PACSATs
automatically (unmanned for extended period of time).

4. About TNC and PC (serial port) interfacing. I used a Tiny-2 TNC with
a 9600 baud modem.

How many bps should the serial port speed be? Ideally it should be
faster than the 9600 downlink speed.
What is meant by KISS mode and AX.25 Unconnected mode used by the
PACSAT? Shall I set the TNC to KISS mode in order to receive the
frames from the PACSAT? Do frames and AX.25 Unconnected mode mean
the same thing?
On top of the frame received from the PACSAT, what headers and
trailers does the TNC add to it before sending it down the serial port
to the PC?

Thanks in advance,

Yours,
Liang S. Ng
Southampton

2173. Connected to MIR... Finally!

Newsgroup: rec.radio.amateur.space
Date: 1994-12-21 17:50:05 UTC
From: jls@capedata.iii.net
Message-ID: <3d9pt0$51m@nic.iii.net>
Source record: 26274

Finally, after several days of trying, I connected to MIR.

I have now set up my dualbander for other ops.. IE: AO-10,
LO-19, etc. Can anyone tell me what call signs they use?
Is there a standard format from the Satellite designator?

Thanks.

Will the REAL KO-25 Please Stand Up?
Look for object number 22828 in the listings. In two line elements, this
is just below the satellite name. Each line has a line number, and then
the object number. Space Command got 22830 and 22828 mixed up, and they
have not un-mixed them. I doubt they ever will, unless they commit the
same error again and it happens to straighten things out.

Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.space,rec.radio.swap

The Jan 95 AmSoft CD-ROM will be shipping December 23, 1994.
Cost is $39 plus shipping $3 USA, $5 Foreign. Over 20,000
files for amateur radio. Plus the CALLSIGN call book, and
AMCALL the new logbook from AmSoft that will auto log from
the CD for you. Over 1,350 Radio Mods. The latest HST images.
Over 700 Megabytes of Amateur Radio Software packed into 1 CD.

Version 4.0 Callsign will search for US & Foreign amateurs by
CALL or partial CALL
LAST NAME, FIRST NAME, or partial NAME
STATE, CITY or partial CITY
ZIP CODE or partial ZIP CODE
Create Avery label mailing lists
Create QSL address labels
When used with AmCall Logbook, will create your QSl contact information labels.

Help locate lost & missing children too. The complete list of
1,100 .gif images from the Heidi Search Center is constantly
maintained with up to the minute changes shown on the WWW at
http://www.halcyon.com./alt.missing-kids.gifs

This CD is published every 4 months without delay every JANUARY, MAY, & SEPTEMBER.

If you would like to know what others think about the AmSoft CD-ROM then read what
the authors of Amatuer Radio & Electronics magazines are writing:

(Peter Henne) says:
>

>APT of OKEAN 1-7 was off during all available
>passes. NOAA-11 imaging is dead, burst and timing
>signals are active. Meteor 2-21 is the only active
>russian APT-bird, signal is weak (antenna-boom not
>deployed?). NOAA-10 is in standby-mode, no APT. No
>other APT-signal 136.00-137.99 MHz 07:30-20:00 UT.
>Lauch of NOAA-J is delayed until DEC 28.
>
Thank you Peter for providing this information. I am just learning to
decode APT imagery, and I was wondering why some satellites were not on
the air when my tracker predicted them. I was also wondering if I was
doing something that made NOAA-11 look like a snowstorm.....now I know it
is them, not me!

Please continue to post your observations. :)

2179. Geos-Tap Question

Newsgroup: rec.radio.amateur.space
Date: 1994-12-22 06:58:53 UTC
From: DVRobson@ix.netcom.com
Message-ID: <3db83d$mbi@ixnews2.ix.netcom.com>
Source record: 26282

I understand how APT images are generated and sent from NOAA LEO satellites and WEFAX is sent from GEOS geostationary satellites but recently I have heard of GEOS TAP. Is it a WEFAX image on C Band TV satellites? What kind of receiver is required to receive GEOS TAP images? I'm interested to see if I can add something to my C band/Ku band system and get WEFAX. Is that a feasible proposition. Any information would be appreciated.

David Robson

: and/or download to have a satisfying experience with satellite tracking --
: voice and/or packet?
: Email or post = much appreciated!
: 73
Wow! A 150 GHz HT. I wanna one for Xmas.
Seriously. I f he only wants to listen, I suggest he listens for
the Dove signals, they are packet and loud. There are Mac
tracking programmes on oak.oakland.edu. Sorry I can not recommend
one I am a PC user (Boo Hiss!). The two line elements are available
on archive.afit.af.mil pub/space. Voice: unfortunately AO21 seems to
have died, that could be received on a modest FM receiver and an
outside antenna on 2 m.
A good preamp and antenna and he might hear signals from FO-20
The digital signals are not FM but PSK, but arre in AX-25.

Sorry I can not suggest a two way system without buying a multimode
two meter rig and a 28 mhz receiver and using RS-10.

The satellite gateway stations do not provide access to the Internet. They are simply an alternative means of packet mail forwarding (much like HF gateways do). In fact, it is likely that non-amateur traffic will get bounced. A gateway node comes a little closer to what you have in mind, since it provides access to the satellites to hams who do not have satellite stations themselves. I wrote the software for that service and used to run a node. I also allowed non-hams to access it via phone, though not via Internet. However, non-hams could only read, not write messages, because third party traffic is illegal with many if not most of the nations that are on the microsats. At this point I know of no service that does what you would like. One possibility would be to get an amateur license yourself. It is not a very difficult matter these days.

Good luck es 73, John WA0PTV (@amsat.org)

>actuals signals I would need to look for and roughly and whats needed to
>process them into something meaningful ??

Radio (g)astronomy means that you receive the RF signals generated in distant objects of the sky, like the Sun, other stars, galaxies, black holes and so on. These objects emit radiation at a whole spectrum of frequencies, RF being only one band of it. Radio astronomy is many times very similar to optical astronomy in the sense that you produce an intensity-coded "picture" of the object, or monitor the intensity of an (apparently) point source. Only the information is carried by waves that have much longer wavelength than visible light or UV.

The close analogy to optical astronomy means that where a telescope is needed in optical observations, a *very* highly focusing antenna is required to receive the radio signal. After all, your sources are rather small (even if you concentrate on the Sun) and you don't want to look at all the other sources simultaneously that cover the 2*pi steradians in your field-of-view. In practical radio astronomy, this has lead to the use of large parabolic disc antennae and even large-scale arrays of these huge dinner-plates.

I don't mean to discourage you, but unless you have access to very exceptional antenna facilities, your radio astronomy hobby might become a very short-lasting one.

What inclinations do the OSCAR satillites have? I live in Minnesota
so if they aren't at 45 degrees or better then any other investigation
I would do into contacting them would be moot.

Also, do you need an antenna capable of tracking the satillite in
order to talk to them? Or would a cheaper omni-directional one
do the job?

Thanks.

Message-ID: <3dfik6$sj2@cello.gina.calstate.edu>
Source record: 26120

Hi Dale,

I am interested in your APT decoding project. My APT scanner is at school and I will not be able to get to it until after Jan 3. If you still need a tape od a wx sat pass at that time, I'll send you one. What kind of receiving equipment are you using? What tracking program? If you are on the correct frequency at the right time you should be hearing sats. (Sorry if you know all this already :-)

Look elsewhere in this newsgroup to see which satellites are active from week to week. Peter Henne (sp?) posts this info regularly.

Good luck!

Bob Houghton

>During the September mission, I copied direct voice and packet from the
>shuttle. I sent in listening reports to the ARRL (who was supposed to be
>handling the SWL & QSLs), and I still haven't gotten my confirmation.

The ARRL doesn't actually handle the QSLing themselves. They just
act as a central mailing address. Individual amateur radio clubs
volunteer to handle the QSLing for each mission.

>Am I wrong in thinking that an SWL rates a confirmation?

Not at all! SAREX SWL reports are confirmed just as two-way QSOs are.

>How long might it be before these confirmations come out?

I haven't heard any rumors about this particular mission. Past
experience has shown that it takes anywhere from a few months
to a year, depending on how soon the crew selects a design for
the QSL card and how quickly the club can round up volunteers
to fill out the cards and stuff envelopes.

73,
Patty
(who is waiting *very* eagerly for her card from this mission
[STS-64] because it was my first voice contact with the shuttle!)

Most are Polar, and available to everyone. Oscar 13 has a highly inclined orbit, but the actual Apogee is at about 6 degrees North. Despite this, it is quite possible for you to use it, as it is very high at apogee, over 40km. I am at 45 degrees Lat., and I get all the sats except the low (28 degree) Shuttle Missions. The high ones (64 degree) are very good.

>Also, do you need an antenna capable of tracking the satillite in
>order to talk to them? Or would a cheaper omni-directional one
>do the job?

Sometimes, people get by with omnis on a few sats, but FAR better results are gained from a directional setup with a G-5400 rotor set. From here, I would suggest you buy or borrow the Satellite Experimenters Handbook. It's got it all.

---

1) Frequencies shown are without Doppler compensation. For typical digital satellite pass the original signal will be about 8 kHz higher than what is shown.

2) WO-18 Webersat transmits experimental and image data and can be captured in KISS mode via PB or TLMDC.

3) Except for FO-20 the digital sats use a program suite containing PB/PG/PFHADD/PHS or WISP. The broadcast callsign (in PB.CFG) is the satellite's callsign with an SSID of -11. The connected mode callsign (in PG.CFG) is the satellite's callsign with an SSID of -12.

4) When in mode JD, FO-20 can be worked with any packet program. Connect to 8J1JBS. FO-20 currently alternates between modes JA and JD on a weekly basis. Check ANS bulletins for schedule.

5) AO-10 is no longer controllable but the transponder works when the satellite is in sunlight.

6) For AO-10 and AO-13, transmit LSB, receive USB. As transmitted frequency is increased the received frequency will decrease, (inverting transponder).

7) AO-21 currently operates on a 10 minute schedule with FM repeater, WEFAX image transmission, and 1200 baud AFSK telemetry in each cycle.

2195. Re: APRS via satellite?

Newsgroup: rec.radio.amateur.space
Date: 1994-12-25 07:26:49 UTC
From: tvr@cnmat.CNMAT.Berkeley.EDU
Message-ID: <TVR.94Dec24232650@cnmat.CNMAT.Berkeley.EDU>
Source record: 26298

The original APRS documentation suggests beaconing your APRS data
through Mir's TNC on 145.55 MHz. I've never seen anybody try this,
but it sounds like fun.

Don't do this automatically without taking proper precautions!

For nearly two years I have been trying to work the MIR on a voice pass,
I have worked it on packet about a zillion times, but really really
wanted a confirmed voice contact. Well, this morning at about 4:30am I
was writing a letter in another newsgroup when I heard the familiar sound
of packet bursts on 145.550, I reached over to my other computer and
booted up Instatrack, sure enough, there was the MIR.. A moment later
came the sound I had been waiting for, CQ CQ in a decidely Russian
accent! I scooted over to the mic and reponded with R0MIR this is
KB7VZL, how do you copy? KB7VZL I copy you very clear, what is
your name? My name is John, I'm located on the west coast of the
United States in Salem, Oregon. How are you this morning? I asked..
Hello John I am BLEEEEEEEEP BLEEEEEEEEEEEP BLEEEEEEEEEP!
...
Cosmonaut!! The packet continued for the entire pass and about
10 minutes after.. Several attempts to get the person on packet
to go voice failed.. I believe this was an un-attended packet
station which was acting on a script file, a very simple thing
to do and a very very RUDE thing to do!

...

If you're going to do this sort of thing, like beaconing through MIR,
make sure you take the right precautions. Like, make sure your machine
can copy MIR in AX.25 mode *before* your machine transmits, and that it
does not continue to retry for very long in the absence of data which
confirms continued packet operation. Perhaps APRS software does this
but i haven't gotten it up yet, and i'm quite skeptical. I am also
skeptical about using MIR (or STS) as a digipeater to begin with.

If you can't program your machine to do this kind of checking, then
stick to manual operation, and additionally, MONITOR your reception to
make sure no one changes modes. The offender, spoken of above, could
well be an inconsiderate manually operated station, who was not able or
willing to listen for voice. Please be careful.

Although I don't remeber all the important info, HST uses the TDRS
system to relay its data to the Earth stations. If I remeber correctly,
this happens in the microwave range, at about 5 GHz.

I have been off the OSCAR 13 satellite for almost a full year now. Getting ready to get back on since moving into a new house. Has the satellite deteriorated much in performance since I was last on?

Any information about the current state of the satellite would be helpful. Thanks.

Bob, KG7WC

Performance, so to speak, is just as it was. There is no more mode J, as the 70cm transmitter died. Mode S has caught on quite a bit, and is available at each apogee.

The big difference is that, although the satellite has the same inclination, the apogee is at only 6 degrees north latitude. This means that you will be anle to talk to stations that you never heard before (like Australia and New Zealand).

This also means that there will be times when the Sun is directly behind the satellite for much if its orbit. this has neccessitated a very steep angle of offpoint (or "Squint") at certain times of the year.

Overall, I think it is just as good. Sure, there are times when it is almost unuseable, but the increased availability of other stations at times makes up for it. I also very much like the increased Mode-S time. It's about time we got off our VHF backsides and got into the 90s (an opinion not universally shared).

My $.002 worth!

To all radio amateurs

SB SPACE ARL ARLS035
ARLS035 RS-15 in Orbit

On December 26 at 0300 UTC, the Russian RS-15 satellite was launched from the Baikonur space center in Russia. The satellite was lofted into space by a "Rokot" launch vehicle. Rokot is a hybrid created from the first and second stages of an SS-19 intercontinental ballistic missle and a new third-stage booster known as "Briz."

RS-15 is only the second Amateur Radio satellite to include Mode A capability (the other is RS-10). The satellite is already operating and several hams report successful contacts.

RS-15 transponder frequencies:

Uplink: 145.858 to 145.898 MHz
Downlink: 29.354 to 29.394 MHz
CW Beacon 1: 29352.5 kHz
CW Beacon 2: 29398.7 kHz

Modes are CW and SSB only.

W1AW will transmit RS15 Keplerian elements when accurate orbital data becomes available.

The RS-15 command station invites signal reports and comments:

2213. PACSAT infor sources & subroutines

Newsgroup: rec.radio.amateur.space
Date: 1994-12-27 23:34:28 UTC
From: lsn92@ecs.soton.ac.uk
Message-ID: <3dq8a4$f2r@monet.ecs.soton.ac.uk>
Source record: 26113
Cross-posted to: uk.radio.amateur,rec.radio.amateur.space
Body handling: HTML body converted to readable text

Hi there,

I am looking for the latest PACSAT related information sources. Are
there any ftp site or web pages or email addresses for this matter?

I am new to packet radio communications to start with. But I am
interested in collected data from the PACSATs. So I wish to find out the
answers for the following basic questions:

1. Are these satellites PACSAT? UO-22, KO-23, KO-25, PO-28.
I am interested in these because they have FM downlink and is very
easy to track. Are there anymore PACSAT not listed above?
Or do all PACSAT have FM downlink at 9600 baud by definition?

2. I read the PACSAT documentation which was produced University of
Surrey a few years ago. It briefly mentioned UO-14 and UO-22. I
understand that these PACSATs worked in two mode: File Server and
Broadcast. I am interested in Broadcast specifically. I would like to
know if anybody has experience in working with the Broadcast mode of
these PACSATs.
Do KO-23 and KO-25 have the same Broadcast mode?

3. What I plan to do is to write a program for automatic collection of
the broadcast frames from the PACSATs. I understand that each broadcast
frame looks something like this:

0xbb

The procedures of my program are:

collect all broadcast frames from the PACSAT
save all the frames in a temporary file

process the temporary file
sort the frames
restore the PACSAT files
extract 'original' files from the PACSAT files

Has anyone written any programs or algorithms for all or part of the
procedures?

I understand that Surrey produced a program called PB. I would like to
be able to track and download frames from multiple PACSATs
automatically (unmanned for extended period of time).

4. About TNC and PC (serial port) interfacing. I used a Tiny-2 TNC with a 9600 baud modem.
How many bps should the serial port speed be? Ideally it should be faster than the 9600 downlink speed.
What is meant by KISS mode and AX.25 Unconnected mode used by the PACSAT? Shall I set the TNC to KISS mode in order to receive the frames from the PACSAT? Do frames and AX.25 Unconnected mode mean the same thing?
On top of the frame received from the PACSAT, what headers and trailers does the TNC add to it before sending it down the serial port to the PC?

Thanks in advance,

Yours,
Liang S. Ng
Southampton

>1. Are these satellites PACSAT? UO-22, KO-23, KO-25

No. By the usual defunition, they are "UO-Sats", but that is not
universal. The Pacsats are 1200 bps and use psk on the downlink, which
needs an SSB radio.

Yes, it is the DOS standby, used for many years. It is available through
the Amsat organizations.

For the last year or so, almost everyone is using Wisp (Windows Satellite
Packet). It is a very sophisticated program that does everything you
would want and much more, so there's no need for you to re-invent that
wheel. You can get Wisp from:

ftp.amsat.org

I don't remember the directory there, but it is easy to find.

I am listening to my S band on AO-13, and I am, frankly, quite irritated. There is some LID there trying to get Mode B to work by holding his iambic down.

I am sure that this has been said more than once, but the Mode B transponder is OFF from MA 130 to MA 160. Transmitting on mode B uplink causes severe QRM into Mode S. Please, before you transmit, listen and see if there is anyone on the downlink. If there isn't, look up the schedule!!!

The AGC is getting hammered by this guy. It sounds like a machine gun being shot ten feet away. BTW, due to the spacecraft design, the 145.812 beacon is ON during Mode S transponder, so don't depend on it!

Sorry for the diatribe, but it is too consistant, and getting on my nerves...

2226. GOES TAP FORMAT

Newsgroup: rec.radio.amateur.space
Date: 1994-12-29 21:54:24 UTC
From: durham@lobby.ti.com
Message-ID: <3dvb6g$nhd@superb.csc.ti.com>
Source record: 26130

I have been unable to find the GOES TAP signals on Spacenet 3, TR17 by mixing the baseband output from
my satellite receiver up 100Mhz and listening around 1.9Mhz with an FM broadcast receiver. There is no
detectable signal near this frequency. Other subcarriers start at about 3Mhz and others can be heard up to
7.2Mhz. These are all music or TV sound however.

Does anyone know what the FM deviation is supposed to be for the GOES TAP service? Is there any video
on transponder 17? I see some weak scrambled signal that may be bleedover from TR16 or TR18.

Are there any published circuits or techniques for obtaining the APT signal? None of the books that
have been recommended were any help. The Ralph Taggert books just mention the subject in passing with
no explanation of the format. The frequencys have been posted several times in this Newsgroup, so they
must be correct but something is wrong with my setup.

Please post here if you think others may have an interest in the subject, or e-mail me at the address
below.

Ken,

The GOES TAP signals that you are looking for are narrow band FM signals. Listening for them with a commercial FM receiver will be fruitless. I have received them with an R-7000 after mixing the baseband video out of the TVRO output into the R-7000's passband. But even with this setup, you'd be as dissappointed as I was at first. The bandwidth of the GOES TAP signals are wider than normal narrow band FM and carrier dropout occurs at high deviation levels. The best receiving system I've pu together is to mix the video baseband spectrum into the receiving band of my normal APT receiver which covers 136-138 MHz. The bandwidth of the APT receiver is a good match for the GOES TAP signals. Now,

After you get to this point, your up against another issue. GOES TAP uses inverted grey scales and scans from right to left. If your scan converter software can deal with this, then your allright. However, most commercial suppliers of APT equipment don't offer GOES TAP capability in order to avoid legal issues with Alden WX Service, those that produce this service on the satellite. If your scna converter is real flexible, maybe you can capture the images properly. By the way, they're the best images your gonna ever find.

Good luck.
Ned Stearns AA7A

NOAA-J was successfully lauched from Vandenberg AFB
today Friday, DEC 30 1994 at 10:02:10 UT, now NOAA-14
in orbit. A 21-day checkout period begins, lets
keep our fingers crossed.
Congratulations to all, and thanks to Michael Baldizzi
who provided live NASA-TV-coverage on CU-Seeme.

2229. re GOES TAP move to Ku band

Newsgroup: rec.radio.amateur.space
Date: 1994-12-30 12:46:36 UTC
From: ken@sislnews.csc.ti.com
Message-ID: <941230124636@ken_durham.linear.sc.ti.com>
Source record: 26138

Kevin

Your posting did not include your name for a return address, so I'll ask my question here. The information may be useful to others also. Do you know which Ku band Satellite and transponder is to be used for the GOES TAP service? Also, what is FM3 and is it possible to detect and decode it for the weather pictures?
Thanks to you and Ned for the answers you posted. I was beginning to think I was listening to the wrong Satellite since there was NO detectable signal near 1.9Mhz on S3 tr17 baseband .....no quieting ....nothing.

Ken K5MBV drham@lobby.ti.com

I think there's even a bigger problem. Alden announced some
time ago that it was leaving C band and moving to Ku band for
its services. Alden was also going to be using FM3 type encoding.
I have not heard that the "analog" in the clear GOES-TAP made the
switch. It was suppose to be 12-1-94.

I checked last week and am checking right now and I am not getting any
signal from Alden's old spot on S3.

Sorry for the bad news, the good news is there's lots of other sources for
weather satellite stuff and today NOAA J was launched and I'm hoping NASA/NOAA
has it fired up so I can listen to it later this morning.

73,
Kevin N9JKP

2231. KEP for RS-15

Newsgroup: rec.radio.amateur.space
Date: 1994-12-30 16:20:59 UTC
From: bjp@cle.ab.com
Message-ID: <3e1c1b$8e2@news1.cle.ab.com>

and was working a QSO last night and someone broke in and asked about RS-15. I never heard of RS-15 I told him.

So if someone out there can help, please email me the kep file and what freqs to work the bird.

NOAA 14 was launched successfully today from Vandenberg AFB and a look at its first Automatic Picture Transmission images (4 km resolution) can be found on the Florida EXPLORES! home page at

http://thunder.met.fsu.edu/explores/explores.html

You will also find a NOAA Satellite Resource Guide there, which includes information about all NOAA satellites, including NOAA 14.

Happy New Year!

2235. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-12-30 22:33:14 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.788826794@falcon>
Source record: 26139

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (205) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Sorry, I'm using Netscape's Mosaic browser to read USENET (I usually read it off the UW's VAX and that does the name and signature automatically.

> The information may be useful to others also. Do
> you know which Ku band Satellite and transponder is to be used for the

The FM3 is a coded digital compression signal as I understand it. Alden needed more thruput and went to this new system. I believe the satellite is Galaxy 4 Ku.

Thanks to you and Ned for the answers you posted. I was beginning to think
> I was listening to the wrong Satellite since there was NO detectable signal
> near 1.9Mhz on S3 tr17 baseband .....no quieting ....nothing.

N3MCX,

I tried leaving you Email at the address below, but the message got
kicked out. Something about not finding a user "TR1610" on
delphi.com. At any rate, here is the body of the message. Get
back to me via Email and please leave me a mailbox address that
will work!

To: TR1610@delphi.com

Subject: Re: WANTED: Multimode TNC
From: darryl.linkow@grinder.org (DARRYL LINKOW)

TR>Darryl,

TR>The software is "PC-PAKRATT for Windows" version 2.0. The everything else
TR>simply meant cables, manual, etc. Let me know.

Sorry, but I do a lot of messaging on Internet Email, and do not
remember what exactly what it is that you are selling! It
helps if you quote part of the previous message when replying to
someone on these nets. That being the case, would you be so kind
as to reply with the full description of the package that you are
selling? I am very interested in getting PC-PAKRATT for Windows
2.0 from you. Just let me know the what the rest is and I'm sure
we can work a deal.
73 de KE6IHA - Darryl

Ken,

I am here to say that GOES TAP is still operational on C band. There used to
be three channels of weather images; one focussed on thee western US, one on
the eastern US and one running METEOSAT 3 and METEOSAT 4 (or 5) alternately.
Some months back, the METEOSAT channel went quiet. They have been switching
the sources of the images from GOES 7 to GOES 8, lately. Images are quitnice and worth the
te nice
and are worth the effort to capture. I hope they don't abandon the C banddistribution for a
whi
distribution for a while.

Ned

2241. Info wanted

Newsgroup: rec.radio.amateur.space
Date: 1994-12-31 17:50:14 UTC
From: Steve Kittelsen <sak1@delphi.com>
Message-ID: <h0x7gAm.sak1@delphi.com>
Source record: 26144

I just discovered this news group, and I'm looking for frequencies to Oscar 20
and above.
I also wamted to know if the telemetry signal from Oscar 17 (Dove) is weaker
than it used to be a year ago or so. I have real problems getting a good
copy of the telemetry data from the satellite on a vertical omni.
Thanks

2242. RS-15 Anyone Worked It??

Newsgroup: rec.radio.amateur.space
Date: 1994-12-31 19:02:10 UTC
From: BRUCE268@news.delphi.com
Message-ID: <3e49ri$6ch@news2.delphi.com>
Source record: 26146

Has anyone heard/worked the new RS-15 bird? I have listened several times and never heard anything, except when RS-10 was also in range. Which leads to my next question: What are they going to do when both birds are over the same area at the same time on almost the same passband?? There also seems to be some questions as to the validity of the keps avalable to date. I have downloaded keps from at least three different sorces and they all put the bird at the same location, but are they correct? Any responces would be appreciated. Good luck to all you RS-15 seakers.
73, Bruce WA4JAV.

2243. PSK modem

Newsgroup: rec.radio.amateur.space
Date: 1994-12-31 20:33:18 UTC
From: Steve Kittelsen <sak1@delphi.com>
Message-ID: <p+0boem.sak1@delphi.com>

I'm currently receiving packet from Dove without a TNC, just the BayCom interface is used.
Now, if I want to receive telemetry from other sats using 1200 or 9600 bps PSK modulation, I need a PSK demodulator or modem. I'm getting a downconveter from 435 MHz to 10meter, and using my digital shortwave with SSB, I should get a signal. Is this signal a phase modulated signal that can be feed to a phase demodulator, then converted to a FSK signal and use the current packet modem on my PC? Or are there PSK modems that connects directly to the serial port? I'm trying to make it cheap, without a TNC and fancy equipment.

Any comment is helpful.

Ken,

Ned is right about it still being on. When I checked for it the other day I had my coax hooked to the wrong output.

Alden is in the process of switching its customers to Ku and like everthing else they've probably fallen behind schedule.

73,
Kevin

2246. Re: PSK modem

Steve,

To receive telemetry from the 1200 bps birds, you will need a PSK modem. As far as I know, they all need to attach the the "modem header" connector on a TNC. (So you will need a TNC). I've not heard of anyone building a "BayComlike" psk modem that works with the BayCom software, although I imagine that this could be done.

The 9600 bps sats transmit FSK FM (the same as terrestrial 9600 packet). To receive this telemetry you will need a 9600 bps TNC and you will most likely need to connect directly to the the discriminator on the FM board of your 10 meter radio. (Wide frequency response needed for 9600 bps signals.)

I would be interested in knowing which 435 to 28 Mhz converter you are going to buy. I am planning to get on the pacsats the same way. I have a nice satellite station at school (Yaesu Ft-736R, AEA 1232, KLM crossed az-el yagis) but I want to set up at home without spending too much money. The only downconverter that I have seen advertized is the Hamtronics unit. Are there others?

Take care,

Bob
